Greets,

Just curious if anyone has any -scanned/digitized-
schematics/manual/etc for a Bearcat 300.

Thanks much in advance.

1821. tk500 v0.2 available, multiplatform software for Yaesu VR-500

Newsgroup: rec.radio.scanner
Date: 2002-04-11 16:46:03 UTC
From: Bob_Parnass_AJ9S <parnass@megsinet.net>

tk500 version 0.2 is now available for free download.

tk500 is an open source programming utility for the
Yaesu VR-500 portable receiver.

Improvements in version 0.2 include the ability to
change several parameters and write data back to the radio.

tk500 has a graphical user interface and runs on Linux
and Windows. I'm still looking for MacOS X beta testers
familiar with Tcl/Tk.

You can learn about and download a beta test version of tk500
from my home page:

http://members.core.com/~parnass

I don't warrant the software, though it will cost you nothing.

Thanks again to Dan Wanchic, WA8VZQ for posting detailed
information about the RDF file layout.

To the disappointment of VR-120 owners,
I don't know of any software available for
the Yaesu VR-120.

Many of the portable scanners fitted with a computer
connection can be cloned (programmed) via software,
but cannot be controlled in real time.

Consider the ICOM IC-R2. It is in the same category
of scanner as the DJ-X3 and VR-120. There is a variety
of both commercial and free software for it.

Another model to consider is the Yaesu VR-500. It
differs from the other 3 models because it has
a full numeric keypad and has SSB/CW reception
capability.

You are welcome to download my new tk500 software
for it at http://members.core.com/~parnass
No warranty, but no charge.

Good luck.

What a crock of shit!!
==========
You are obviously deranged. I put together a database and offered it to anyone who fancied trying it. Putting a password on the zip was (as stated on the website) for no other reason other than to monitor how many people were actually using the database. I have NEVER used any of the incoming email addresses for any of the purposes described in your pathetic ranting and have NO INTEREST in any sort of "marketing". I have never spammed ANYONE!

I INVITE ANY USER OF MCQ_LOG to post a message here saying whether they have received any unsolicited email as a result of downloading my database.

Who the hell do you think I am? I'm an average Joe with a full time job and have no connections, desire or ambition to enter into any of the shit you are talking about. I am certainly not a programmer either! What a pathetic and nasty little man you are! The day that YOU offer the SWL Community something for free is the day that YOU can call me names!!!

To be honest, you've written so much damned drivel that I couldn't even be bothered reading thru it all. You have shown YOURSELF to be the lamer here and judging by your ridiculous rantings, I'm just glad for your sake that you live in another country .... you'd be locked up if you lived here!!

Go kiss my ass!

Tom McQ.

SNIP> Well to tell you the truth Tom here is a real shady programmer. All
> those emails he made you send him to get the password for his program
> are now being sold to the highest bidder for SPAM.

Okay, I say to you that I do NOT collect email addresses for the purposes of spamming people or selling them on as you suggest (hahaha - nutcase!). To prove that fact (not that I have to), I have REMOVED the password from the zipfile and require NO EMAILS from anyone!! Further, if anyone who has already emailed me wishes to be removed from my PERSONAL address book and not receive any info about future updates, they can let me know.

I notice now that you have started to flame me on other newsgroups too. Well so be it. You have totally soured what was a well intentioned act. You are merely proving to the world what an absolute ass you really are. In recognition of your inadequacy as a human being, I will make this the LAST comment in regard to the subject.

Tom "MadDog" McQ
www.ar3000.info

PS : Sorry, just remembered that in addition to everything else, you accused me of mailing viruses to you. You are an absolute LIAR!

1833. tk500 v0.2 available, utility/cloning software for Yaesu VR-500

Newsgroup: rec.radio.scanner
Date: 2002-04-11 23:58:57 UTC
From: Bob_Parnass_AJ9S <parnass@megsinet.net>
Message-ID: <3cb62352$0$1526$272ea4a1@news.execpc.com>
Source record: 49549
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave

tk500 version 0.2 is now available for free download.

tk500 is an open source programming utility for the
Yaesu VR-500 portable receiver.

Improvements in version 0.2 include the ability to
change several parameters and write data back to the radio.

tk500 has a graphical user interface and runs on Linux
and Windows. I'm still looking for MacOS X beta testers
familiar with Tcl/Tk.

You can learn about and download a beta test version of tk500
from my home page:

http://members.core.com/~parnass

I don't warrant the software, though it will cost you nothing.

Thanks again to Dan Wanchic, WA8VZQ for posting detailed
information about the RDF file layout.

1834. Prices Reduced on Remaining Scanners

Newsgroup: rec.radio.scanner
Date: 2002-04-12 00:00:51 UTC
From: allanstern@aol.com
Message-ID: <20020411200051.20524.00002677@mb-mn.aol.com>
Source record: 49550

Here is a listing of the scanners that still remain to be sold by my friend Harold McNeal, in Orlando. He has reduced the price of these units. Some are Mil Comms capable, and some are Trunk Trackers. I know all of these to be in top condition. Terms of the sales are:
1. Price includes shipping to any CONUS address.
2. Price includes wall wart power supply or power cord.
3. Price includes manual and indoor antenna.
4. Radio will be shipped upon receipt of US Postal Money Order.
I prefer that you contact Harold directly, in Orlando, at 407/852-0693 (his NEW Number!) to arrange to mail him the payment. I will be glad to answer any questions if you want to contact me at 321/777-2018.

AL STERN Satellite Beach FL

ITEMS FOR SALE (UPDATE/PRICE REDUCTIONS)

Pro2053: RS#20-466. Trunk Tracker; Mfr:GRE. Base Model; 300 Ch; Moto I/II and EDACS Trunk Tracking; Scans trunk and conventional at same time; 25-54, 108-174, 216.0025-225, 406-512, 806-960, 1240-1300 MHz, no cell; Triple conversion; 25Cps Scan Speed; 50Cps Search; switchable 20db Attenuator; backlit 4-line LCD display; Alphanumeric frequency IDs; Weather Alert displays type of alert; Service searches for police/fire, Marine, CB, Ham, and Acft; Computer port; cloning capability; Faster than the 2067. (Orig Radio Shack price: $249.99)
Price: $160 shipped. 2 units for sale. (Prev unlisted)

Pro2052: RS#20-432. Trunk Tracker; Mfr:Uniden; Base Model; 1000ch; Moto I, II, I/II & EDACS Trunk Tracking; 29-54, 108-174, 179.75-512, 806-956, 1240-1300 MHz; 50Cps Scan; 100-300Cps Search; 5 Service Searches; Data skip; 50-Ch Search Skip; Weather Alert, RS-232C port for computer uploads/downloads. Monitors UHF Mil comms. (Orig Radio Shack price: $369.99, later $299.95)
Price: $160 shipped. 2 units for sale. (Prev price: $200)

Pro2050: RS#20-430. Trunk Tracker; Base Model; 300Ch; 10 Banks; 29-54, 108-174, 406-512, 806-956 MHz; 50Cps Scan Speed; 5 scan lists to store 50 talk group IDs in each bank (total 500); 300Cps Search; Data skip switch; 50 Search Skip lockouts. (Orig Radio Shack price: $299.99)
Price: $75 shipped. 1 units for sale. (Prev price: $100)

Pro2048: RS#20-417. Base Model; 200Ch; 10 Banks; Triple Conversion; 29-54, 108-174, 406-512, 806-956 MHz (no cell); 50Cps Scan; 300Cps Srch; 20 Search Skip lockouts; Data Skip switch; 10 priority channels. Wonderful speed; great for VHF air; scans all 200 channels in 4 seconds.
(Orig Radio Shack price: $229.99)
Price: $60 shipped. 1 unit for sale. (Prev price: $75) (A definite steal)

BC350A: Base/Mobile Model; Prepgmd Service Searches; 50-Ch programmable (20 Choice,20 Police,10 Fire); 11Band; 100Cps Search; LCD display; 29-54, 108-174, 406-512 MHz; 3W Audio. No radio is more sensitive in the VHF aircraft band. Price: $40 shipped. 2 units for sale. (Prev price: $60)

Hi all,
Recently I heard humming sound inside my scanner. The machine is not even on. I am almost positive that it comes from the power supply or transformer because when I touch the top part I feel vibration. Digital number is also fading. Does anybody have this kind of problem? I appreciate any help. I just didn't know how to solve it Thanks. Tony.

It would be my favorite too, IF it could just link banks when scanning.
Why won't Icom pay Uniden or GRE the royalty for some of the featues they
could easily put in there? An R2 that scanned a little quicker, linked
banks when scanning would be a killer little radio. I would be willing
to pay a reasonable amount for this...

Sorry Tom, I put it in that you had not done the virus thing and it
was an intentional slur. However Tom you did mail bomb me before I
even had a chance to write you an aplogy. YOU DID MAILBOMB ME WITH
SPAM. I see that you do not even respond to that accusation showing
you to be a real lame ass bastard. But of course if you want me to
post the logs that I have showing you that you did sign me up for spam
well sure I will do that. Why did you not respond to that accusation
anyway. I think I have been quite nice about the whole thing after
what you did to my email address. But I said again many times in the
message last posted here in this group that I would like to end it
here. I did not see the password request on the web site and If it was
there it was pretty hard to see at the time but again it was late and
I was moving along pretty fast. I am not really a scanner buff rather
I am a Ham and into amatuer radio. I see that you have been accused
before on various places of being an idiot like when you tried to open
your own newsgroup the admins got pretty tired of you asking so many

times they got pissed at you. Plus I see you do allot of posting and so you are somewhat literate. I would like again to apoligize to you for the flames and the posts. I did so after seeing what you did to sign me up for all that spam. I talked to your ISP today and they saw the logs of what you did and the times you were on and so forth correspond to the attacks that your logged by the mailers you signed me up for. I was pissed at that and did the same back at you but tired of it quickly and moved on. I was reading the newsgroups and saw you posted about our little engagment and that really pissed me off because you were not truthful with the events so I thought to clarify them. Sure I admit that you worked hard on your program and its up to you how you distribute it and I have no right to question that. But as other posters to you in other newsgroups have said I have a right to voice my opinion about it and I voiced it to you and you only. You were the one to tell the world about it not me. So if you take things to a public forum be prepared to suffer the consequences. You have been told before to shut the fuck up and so have I so hey I will quit right here if you do. I said the apologies first and I do not really feel that I should aplogise to you after all you mailbombed me for no real reason other than to fuck me over for the hell of it. BTW cool that you thought to take that out I really wanted to try out your program and had this not happened I am sure it would have been a nice program from what I have read about it. Anyway Best Regards.....

1.Most likely, if you look in a line from the base of the phone to the side of the house you had bad reception on , you'll see a large appliance or some such in the house blocking the signal.

2. Are you sure you weren't monitoring the handset freq.?
How did the friend across town sound to the guy holding your phone?

Is there anyone here that actually listens to the Beachwood, NJ fire department? I assume they're dispatched on one of the county fire freq's, but I am not sure which. I also want to know which freq's they talk on (fire ground, etc...). I have a list of frequencies, but I need to know which is which! Any help is appretiated. Thanks!

1851. Newbie question -- Pro-90 -- How to program current freqs

Newsgroup: rec.radio.scanner
Date: 2002-04-12 17:22:38 UTC
From: Johnny <barelybad@kc.rr.com>
Message-ID: <yJEt8.20191$Vv5.4693272@twister.rdc-kc.rr.com>
Source record: 49566

To all the friendly, helpful people here,

This is my first post to rec.radio.scanner, and although I'm a newbie here, I've spent a few hours going to various Web sites trying to get an answer to this question. If I oops I hope you'll forgive me. If there's a FAQ I should read before asking my question, let me know.

Here's my question:

I have a Radio Shack Pro-90 TRUNKTRACKER, and I want to program it with lots of fun freqs. How do I do that?

Specifically, how do I use the damn thing even if I do know the freqs I want to program? I've tried to make sense of the manual, and I can't. Is there some secret to making sense of the terminolgy that specifically helps me to program given freqs into my scanner? Is all this a big secret I haven't figured out yet?

More important in the long run, how do I know which freqs to program? I live in Kansas City.

Thanks for any help you can offer.

Source record: 49567

Hi,

How to program frequencies on a pro-90:
press "manual" "channel #" "manual" "freq" "E"
so like recording 460.075mhz into spot 10:
'manual' '10' 'manual' '460.075' 'E'
The scanner has 10 banks of 30 channels each, so you can divide your
frequencies in whichever way you want.
A second way to program is to use the up/down arrows to get to the channel
you want, then do the '460.075' 'E'

How to know what frequencies to program?
Look at the FCC's website and search for local things you want to listen
too, or ask people what frequencies they have for what specific things.
If you need to do trunktracking, that is much more complicated.
-Adam

I am using a 870XLT in a car...It works great,but when the car is on it gets static...I am pretty sure its the lousy antenna...Its one of those ratshack thru the glass stick on types...Its all I could find locally that would work....Is there a trunk-lip mount scanner antenna for 29-1300 mhz? I dont mean a magnetic mount...I mean a trunk mount like a cb radio would use with the little allen head screws that hold it in place.....I assume a trunk mount with a good ground will stop some of the static I am getting...I am new at this so I am learning as I go.......Please direct me to places that sell good mobile scanner antennnas! Thanks in advance.......Tommy J.
PS ..The car does not have an electric fuel pump..I know this can be an issue sometimes.....But not this time!

But of course! I have a bc245xlt and ooh it is so lame compared
againts the R2. The bc245xlt has a poor construction, a "feel cheap"
sensation, AWFUL sound, not-as-good-reception, way limited step
sizes...and the list can go on!

Yes I ocassionaly use the bearcat but ooh I would never change it for
the R2. Its like riding a Toyota Camry when you have a BMW... :)

I thought you were expecting an awful lot for that scanner, when you asked 48.00 for USPS shipping and insurance (that's a LOT of insurance!). The I figured it's a typo for $8.00. You might want to see if you can correct it before anybody bids on it. I always miss something in my own listings.... Good luck.

I pre-ordered (and paid for) AirNav-4 and hooked it up for the first time tonight. It started off pretty well at first, but wasn't long before it started to become unstable. I think the best thing that I could say at this early point is that it does NOT like to share resources with other programs, so if you are like me and want to have other software running in the background, beware!!

Instability and resource-greed aside, I am pretty impressed with the new layout and high-res, hi-detail maps. There's a host of new things that you can do with this version BUT there's what I consider to be a REAL limitation in terms of window layout and this limitation was present in V3.1. Basically, you STILL cannot move certain windows outside the main window. For example, I have two monitors and would love to be able to drag the World Map window over to my second monitor, leaving the option to display another map on the primary monitor, but no, that's not possible. Seems such a shame to be operating in a windowed environment without having the usual window-capabilities.

Anyone else ?

Hi,

I haven't noticed any difference in my daily dose of SPAM - perhaps the increased SPAM is due to another source??? You can't please everyone all the time, especially when what's being offered is free. I learned that which is why I've never repeated my offered of the log (in Access 2k) that I wrote.

Compressed Air is going to do nothing. Go to a local radio shop (or Maplins, Tandy, etc) and buy a can of "Switch Cleaner" and spray that instead. It should sort it out in a flash :-)

What was the total time ? If it was much longer than 15 minutes it
probably was not a satellite. Go to a website such as amsat.org and
download a free tracking program and check out the time the sats are in
view.

1867. 417.750mhz Satellite downlink ?

Newsgroup: rec.radio.scanner
Date: 2002-04-12 23:52:48 UTC
From: j999w@aol.com
Message-ID: <20020412195248.07791.00002879@mb-mp.aol.com>
Source record: 49582

I've got 417.750mhz in my scanner as one of the local DEA frequencies, but I heard something unusual on here this week. Around 10am CDT the squelch broke with a data signal that gradually got louder until full strength for about 10 minutes, then gradually faded into the noise, never to be heard again. From my experience, this sounded like a satellite downlink. Web searches on Google, didn't come up with anything.

Ideas ?

if what was stated below still doesn't work. get a new volume switch. Most volume switches are Variable resistors and are very easy to get. My wholesaler sells lots of them.

Look up scannerworld or any other antenna dealer on the internet and get a decent mobile antenna. Trash that RS junk and stay away from window mounts in general, they just don't work.

I mounted my hustler MOR antenna between the hood and front fender it it works great on my "760XLT" scanner. I have use this configuration on three vehicles now and I am very satisfied.

I have a ancient Bearcat Model BC-U scanner for sale.
It is a 1970's vintage 8 channel UHF crystal controller.
I injected a 10.7 Mhz signal and the IF and audio
work, but the radio does not scan.

The scanner is in fair condition, with scratches some rust and tape marks.
The radio may be repairable or would make a good parts radio.

Price is $10 plus shipping from zip 07737.

Regard's

Mike N2MS

Does anybody no if third party control software for the Icom PCR 1000 can be used with the Icom PCR 100?

There is a nifty little PCR 1000 control program for the written for the Palm Pilot. I'd like to use it with my PCR 100.

Thanks

Tate

I understand that the Panasonic "Digital Spread Spectrum" doesn't really transmit a digital signal.

I'm wondering if any of the other cordless phone makers: Sony, Uniden, etc. have digital cordless phones that really transmit AND receive in a digital format?

I know someone could still use a digital demodulator to hear my conversations, but I want them to at least not be able to use a standard analog scanner.

Thanks,
John

if they are " spread spectrum " ... they are secure (for the most
part) , no matter what you call it.

>
>I'm wondering if any of the other cordless phone makers: Sony, Uniden,
>etc. have digital cordless phones that really transmit AND receive in
>a digital format?

I'm not aware of any that claim to be digital or spread spectrum that
aren't. There are some phones (Panasonic) that claim to be 2.4 gigs
and use both 2.4 gigs AND 900 mhz , both. (thus not being true 2.4
gig units) ... maybe someone else has information that I do not
have.

>
>I know someone could still use a digital demodulator to hear my
>conversations, but I want them to at least not be able to use a
>standard analog scanner.

intercepting and demodulating digital cordless phones is out of reach
of all but an elite few , highly skilled , people. Even fewer people
can intercept and demodulate spread spectrum. it's HIGHLY unlikely
that you will ever come into contact (personally) with these people.
It's even less likely THEY would have any interest in listening to
your phone calls. You are FAR more likely (however unlikely) to
be intercepted by phone taps placed on your outside phone box., a
neighborhood box , or area junction box . (neighborhood units are
usually local ,in a neighbor's back yard < in suburbia > and
susceptible to local phone phreakers inquisitive teens , and perverts
... etc. Area boxes are a bit farther away and usually have several
hundred local neighborhood lines in them. They are always on a local
road near a corner by some traffic light boxes or similar places. Look
around and you will see them all over the place. (those large square
two door boxes and large silver bullet looking things along country
roads) The police , federal agencies , slick divorce detectives <
disguised as phone company people > , and bounty hunters are most
likely to frequent these boxes for taps. (nearly ANYONE could , as
they are easily available and VERY poorly secured . A white pickup

truck and tool belt will get you by , totally unnoticed)

Neither a standard scanner , nor the new digital scanners (so far , at least) could intercept any of these types of cordless phones.

krackula

I'll agree with the poor construction and cheap feel, and I really like my R2, but every (working) 235/245 has beaten it and other R2's I have had to program, receive wise in every band. Less intermod, slightly more sensitive. The R2 is a LOW priced radio, it's no BMW in any way. Now the R10 I had beat the 245 hands down, reception wise, but scanning was truly pitiful. If only Icom would pay the price to Uniden or GRE, and make a trunking scanner, that would be great....really a "BMW".

It would be interesting to see what their price is vs. Sherwood Engineerings.

DCS is used to notify a specific person you are trying to contact them. If you and a another radio op program a frequency and add a dca tone to it, everytime one of you keys up, the other persons radio will sound a tone alerting you that the other is trying to contact you. The Police and other public safety agenies do not use DCS. Well, maybe some federalis do but DCS technology has recently found its way into the ham radio community. My hand held has DCS capabilities but I dont use them.

Your answer lies in the fact that when the car is off, there is no noise.
The most probable culprit is the ECU or ignition system in the vehicle
creating a lot of RF hash. I'll bet the problem is the worst on Low-Band.
The RS glass mount isn't the greatest, but if you raise the noise floor
far enough, ANY antenna will perform poorly.

Get some Tuner Control cleaner & lubricant at Radio Shack.

Cat No. 64-4315

Worked very well on my 2004. Just take the knob off, squirt some
cleaner onto the shaft, replace knob, and turn knob through entire
range of motion a few times.

Scratch gone.

WD-40 will also work but doesn't seem to last as long.

```
Stepping boldly to the clearing
Wearing frowns of young boys who've all
ventured well beyond hearing
Mom's unconditional call,
Suddenly they're frozen by the stunning sight
of the thousand swirling lights of a thousand fireflies
swimming madly through a dark and empty field,
they yield to the magic of the thin dusting of light
from a thin giant Moon, a Great Hunter's Moon
Her power over their young unlying eyes
Causes the boys to pause their flight
Along the path leading to the men they're soon to be;
men who will know too well all that money buys.
And all too soon they will find the moon to be
nothing more than a round light in the sky.
```

TJ I don't have a problem one with my 760. In fact I bought is last year off ebay, cleaned it up and put it in my Chevy Tahoe and it works very good. It receives as well as my commercial 2 way county radio. NO STATIC

Change that antenna, you will see the difference immediately. You could even go to a mag mount on the roof. Try it with a mag mount cb antenna, you know you can receive on a piece of wire or coat hanger, etc. sticking out the antenna port.

The problem is they aren't really spread spectrum. That's why I put it
in quotes. Panasonic claims it's spread spectrum, but what they mean
by that is that it hops around to different frequencies at different
times. The rate of the hopping isn't that great either.

Since there is a digital circuit that controls the hopping, they claim
it's Digital Spread Spectrum.

It's really an analog signal that is VERY easy to listen to with a
$400 Uniden scanner.

802.11b is spread spectrum, right? Is it secure? Go to
www.wardriving.com and then tell me how secure spread spectrum is?

Panasonic is one that claims to be digital spread spectrum and is most
certainly not.

> >I know someone could still use a digital demodulator to hear my

> that you will ever come into contact (personally) with these people.

:-) I'm one of those people. See, you just came into contact with one.
:-)

It's not as hard as you might think. Go find an EE student who has
taken a DSP class at your local University and you'll have 90% of
what's required to demodulate these signals.

In most cases you need discriminator, or ideally pre-discriminator
output of your receiver. You need to be able to downconvert this
signal to baseband so it can be digitized. Once it's digitized, crack
open any text book on DSP/communications and implement a demodulator.
Most of these phones don't use a complicated vocoder if they even use
one at all. A standard FM demodulator usually works well once you get
to the voice channel.

> It's even less likely THEY would have any interest in listening to

> disguised as phone company people > , and bounty hunters are most
> likely to frequent these boxes for taps. (nearly ANYONE could , as
> they are easily available and VERY poorly secured . A white pickup
> truck and tool belt will get you by , totally unnoticed)

There is a big difference between my concern about scanner listeners
and about being tapped. If my phone is tapped, most likily I'm
personally being targeted. I'm not too worried about this.

My real concern is the average Joe who buys a $400 Uniden scanner and
starts scanning 902MHz to 920MHz and hears my conversations.

Since I want a cordless phone, I want to at least make sure I pick the
one that is most secure. I realize if I really wanted real security, I
would use a corded phone.

> Neither a standard scanner , nor the new digital scanners (so far ,
> at least) could intercept any of these types of cordless phones.

I disagree.

I was hoping that someone else has already done some research and can provide some guidance on this. Worst case, I can pick a phone, buy it, bring it home, and use a scanner and other tools to analyze the signal to determine how hard it would be for someone to intercept. This takes a lot of time and trips to the store. If someone's already done the work, I don't have to.

Hi
I had one of these VR120's, I myself really liked it, it has a nice *chunky*
feel to it. and it has that distinguished expensive *Yaesu* feel/touch to
it, if you know what I mean, very classy radio, nice to operate and listen
to, easy when you get the hang of it, I have bought and sold dozens of
scanners over the years, but that is one I wish I had kept., with regard to
the aviation band, no problem at all, it will suit you ideal, and for the
price, excellent. I don't think you will be disappointed.
regards
Sorcerer

Emergency Situation Report e-mail list for Pennsylvanians

PA-SitRep is a free, 100% non-commercial,
nonprofit, e-mail list and web site.

The PA-SitRep emergency traffic e-mail list is a
tool that will enable you to monitor and report on
major emergency situations throughout the State
of Pennsylvania including weather emergencies,
natural disasters, environmental disasters, civil
disturbances and threats of terrorism, major fires,
and manhunts.

Subscribers are encouraged to utilize their home,
work and cell phone e-mail addresses for receiving
messages from the PA-SitRep e-mail list.

Message volume on PA-SitRep is EXTREMELY
low and users may subscribe and unsubscribe
at any time.

PA-SitRep is also building a list of PA-SitRep
Contacts, many of whom are Amateur Radio
Operators with HF capabilities. Contacts monitor
our higher volume SitRep/Discussion list and
have unrestricted posting privilages to the
main Situation Report list which is moderated.

Please visit the site to learn more:

http://www.pa-sitrep.com/pasitrep.htm

Thanks. We'll look forward to your participation.

DCS is digitally coded squelch, and consists of a group of codes used much like CTCSS tones. It is also referred to as DPL (digital private line - a Motorola name for digital squelch). It has been around for several years, and in fact many commercial 2-way radio services, including public safety, use it. It has only been added to ham radios in the last couple of years but has been around much longer than that. Not used anywhere near as much as CTCSS, it is nonetheless used in exactly the same manner on many systems.

I also pre ordered and paid for and then dled 4.0. It is a buggy little program. In the Flight List Grid rather than getting a colored box for how you heard a particular plane before I get a little box full of binary numbers.
As near as I can see you cannot show political boundaries on the maps. AirNav 3.1 maps will not load in this version either. I had a nice map that centered around the main airport I live by and I cannot make as nice a map on 4.0. I use this exclusively with ACARS broadcasts and get excellent results with the AirNav Acars decoder program and not so good of results with Airmaster 2000. With 3.1. Airmaster 2000 worked better.

It has been stable for me and I do run a weather station program at the same time with no problems. The minute I try and run Acars Log Analyzer or Selcal decoder at the same time, they will not even load.

As an aside, one thing I have found very helpful is running the AOR Airband filter on my antenna and that has made a huge difference. I use an Icom R7100 with a discone antenna and get excellent ACARS copy since I put the filter on.

Thanks, but that won't help. I need to know specifically which freqs
are used for what. That website, as any other will, would just show
what they are SUPPOSED to be used for, or what they're listed as. I
need to know from someone who actually monitors the Beachwood, NJ fire
department. There's better source than the ones that actually monitor.
:)

Does anyone have HF, VHF and UHF freqs for the oil rigs off Galveston, TX? Freqs of helicopters and boats serving them, intra- and inter-rig comms, etc. would be of interest to me.

Thanks!

Does anyone know where I can find a chart that matches frequency range
to antenna length? Id like to know to what size I should adjust my
scanner handheld whip for each frequency.

Examples:

Frequency Length
25-50
138-174
406-512
800-1000

1916. bc200xlt manual

Free Logging Database available, complete with Station Locator containing
over 5000 International Broadcast Stations.

Would suit HAM operators and Shortwave Listeners alike. May even suit Radio
Clubs.

Records the following:

* User ID
* Date
* RX Freq
* TX Freq
* Pwr
* Mode
* Station ID
* Station Class
* Tx Site
* Tx Type
* Country
* SoundRecording Path
* SINPO
* Equipment Used
* QSL Record
* Free-Hand Comments
* AND MUCH MORE
In addition to the above, there are a wide variety of printable REPORTS
based on the information logged.

Feel free to find out more at :

I spent so much time (6-7) yrs listening to cell phn conversations I wore out the kep pad on my radio shack scanner. Radio Shack sent it off and when returned said it couldn't be repaired (There are folks like me who actuially enjoy this perversion)
I want to buy a new scanner and I know they don't pick up cell freqs. I recall years ago seeing this "cell antenna" that replaces the factor and it is supose to pick up the freqs I want. Has anyone on this board seen one, own one and/or actually used one and if so how was the quality.

Tom,

Here is a simple formula to figure 1/4 wave antennas. Divide 234 by the
frequency.
Example 1/4 wave antenna for a frequency of 453.000 mhz 234/453.000 =
.516 or 6 inches

Hope this helps Good Luck --Dan-- KE3UC

I have that problem in my Suburban. TJ, either wire the radio directly to
the battery (make sure you have a good fuse),
get an ignition noise filter (capacitor) from RS, or both. I agree with
Skweezieweezie; it sounds more like an electrical noise
problem than the antenna.

The other replies are right on. Mine mostly is redundant but I had started it and don't want to waste it!

234 divided by frequency in megahertz gives you the length in feet for a 1/4 wave antenna. Multiply by 12 for length in inches. This is in free space theoretically, and actual wavelength in a conductor will be a bit shorter (multiply by 0.8 if you care), but for your purposes it will not matter. You could spreadsheet the formula and print a chart from DC to light. Make your steps perhaps every 10 or 25 megacycles from 50 to 1000 megacycles. That would be practical.

Memorize a few bands, like 150 and 450 and 900 megacycles, 18 inches, 6 inches and 3 inches respectively, rounded slightly and the difference for receive is insignificant. If you memorize these three, you can interpolate in your head to anything else. You will see the pattern. 50 megacycles will be three times longer than 150, or 54 inches. That's probably longer than your antenna telescopes.

A whole lot of this is pure theory, and does not take into account practical considerations. Many times, especially if you are in a strong signal or high background RF area, you are better with a shorter antenna than a longer one.

Most people would be benefitted more by using an attenuator than a preamp.

There are a few antenna articles on our website Articles section which have theory and practical, in a very easy to understand form. The articles are aimed at law enforcement surveillance technicians, but the principles are identical. All have been published.

All that having been said, put the antenna to where it receives best, which will change with different stations very close in frequency, and will change as you move around, with weather, season and many other factors. There is theory behind all the apparent vagarities. The ARRL Radio Amateur's Handbook (any year) is a good place to start if you are interested in pursing it.

I have several Panasonic hopping chassis here (needed them to
" borrow " the spreading PIN from .. for testing) all of them are
spread spectrum. Never heard of a consumer " hopping " radio that
wasn't spread spectrum.

>
>It's really an analog signal that is VERY easy to listen to with a
>$400 Uniden scanner.

totally false ..there is NO (read that absolutely NONE) consumer
scanner ..not even for $5000 that can receive ANY hopping signals
of any kind. This is especially true of Uniden equipment. Don't
confuse trunking signals with frequency hopping types ..they are
" radically " different types of emission. Hopping radios have VERY
short dwell times compared to trunking radios ... analog audio
on a hopping radio would be VERY difficult to integrate properly.
Hopping radios , by their very nature , have to have digital voice
encoding. (phase demodulation of FM signals has certain " native "
time latencies by design)
Trunking radios can track changing channels (which are very slowly
changing) because there is a control channel to tell the scanner

where to go. Cordless phones have NO such control channel , thus preventing ANY scanner from following them. (has to be chip prearranged algorithm or carrier encoded digital signal sync to work properly. Neither available in ANY scanner ever made)

>
>802.11b is spread spectrum, right? Is it secure? Go to
>www.wardriving.com and then tell me how secure spread spectrum is?

like it said it's TOTALLY secure ..if they say it isn't they are full of crap.
Panasonic , Sony , Vtek ..nearly everyone making spread or hopping spreaders use the same Rockwell Company spread / hopping engine chipsets made in the usa. So far ..the only way " any civilian " has decoded them is by using the proper proprietary chip set and manipulating the eprom spread ing code. Open your Panasonic phone and THAT 18 or 21 digit number plastered inside both the handset and main unit is the spreading code. There are , at the least 10s of 1000s of potential similar codes that it could also be. It takes a " serious " mainframe to process all the potential combinations to get the proper working code that will demodulate the signals. Left to full time trying .. it can take weeks for a parallel processing p4 computer to make the right choice. This is ALWAYS longer than the conversation takes and usually requires many months of trying to get enough airtime to compare against. Hardly worth it for a home conversation. (it's FAR easier to just bug the phone line .. in this case) Only the government has the lists of codes that ALL makers use. They can easily get your conversation on the first attempt. No matter what kind of phone you use , they , can eavesdrop on it in some fashion or other VERY easily. Civilians ..forget about it , ..government ..there is nothing you can do to stop them ..other than not use a phone at all.

If you have a hopping radio of any kind , not to mention spread spectrum ... your conversations are VERY secure from any civilian eavesdropping of the radio signal , plain and simple.

Not sure ... have different ideas ...?? ...then it's VERY simple to use internet phone and the new FREE Pgp voice encrypting communications software to secure your calls. If you need privacy to that extent ..this is the only way to fly. Not even Uncle can eavesdrop on this stuff, plus all your long distance is free too.

1932. Low-band VHF Skip

Newsgroup: rec.radio.scanner
Date: 2002-04-14 04:33:41 UTC
From: caradoc@kingaroy.big.net.au
Message-ID: <21e4779a.0204132033.6f2c10fd@posting.google.com>
Source record: 49448

Down here in the Australia/New Zealand region, when we scan the 30MHz-50MHz range, we get skip signals (military/police/fire/amb) from Korea in our west, from China in our north and from the USA in our east. Range Control comms from places like Ft Hood, and State Police comms from places like South Carolina and Florida, make for good "exotic" listening here (on a UBC9000XLT, 20dB pre-amp and a discone).

My question is - what skip can others, in other parts of the world, hear in these bands?

Thanks
John Batty

Here in the North Eastern part of North America we receive "skip" form
California and the southern states
much of this will be going away due to 400,800 and 900 Mhz trunking radios
coming on line for Law Enforcement here in America. Also "skip" can
come over the Atlantic ocean from East Africa.

Hi All,
I have been using Airnav 3 with no problems but I am trying Ainav 4 with the following problems.
My machine with Win Me the program loads and after the first tip of the day it just locks up and fails to respond.
With Win xp it loads ok but when I download from the internet it downloads 1 of 6 ok but as it switches to 2 it locks up and fails to respond.
This happens every time, I have sent an email but have not had any replies in the past and I am a registered user.
Any thoughts ?

Best regards Baz

Hi Baz,
Mine locks up and gives error message "ANST caused error in anst.exe"
occasionally.

After playing around a little further, I'm beginning to see a relationship
between the crashes and the "Internet Download" of AirNav.

I've had a reply from AirNav Support but it was the old chestnut..... "Do
you have a virus-checker running in the background". Der!!

I'll keep posting here to update you.

Regards,

Tom www.ar3000.info

Message-ID: <T%gu8.12408$4D6.726@rwcrnsc52.ops.asp.att.net>
Source record: 49460

Yes there are, however you don't need a scanner/receiver capable of CTCSS or DCS to listen. You only need that if you want to only listen to one service on a channel that is shared by multiple services.

In other words, with no tone (CTCSS or DCS) setting on your receiver, you will hear everything, regardless of what tone it is using. If you use a receiver that is set to a specific tone, then you will only hear transmissions that have that specific tone and will not hear any others. As a general rule, not using a receive tone lets you hear more, and the only time you really need to know what the tone is, is if you need to transmit on the frequency (and some services use different transmit and receive tones, so just figuring out what tone they transmit does not mean you know what tone they receive).

For example, family radio service (FRS) radios have 14 frequencies they can operate on. Many have a variety of tones they can also use. Let's say someone is using a radio set to channel 3 tone 3. You use channel 3 with no tone. You will hear them, but they will not hear you. The tones provide no privacy, because you can hear them so long as you are not using a tone. You don't need to know what tone they are using in order to listen to them, only to talk to them.

I have a radio shack Pro-92 scanner which will almost instantly decode ctcss or dcs tones on a transmission. The scanner kind of sucks as a trunk tracker (IMHO), but is great for identifying tones. It will also let you program in a tone as a filter so you only hear traffic that is using the proper tone (which is what tones are all about to start with), but normally doesn't enhance scanning type of listening.

Carl.

You COULD use the car antenna, but you'd need a connector-adapter etc, plus the am/fm antenna cable is likely not very good for scanner-frequency ranges. And that suction-cup thing that comes with the BCT-12 is pretty lame.

Two suggestions I'd make would make:

MY favorite, which I use and recommend highly, is a window-clip mount... it hooks over the top of a side-window glass, and you attach a rubber (or other) antenna to it. It's pretty low profile, no holes or scratches in the car's paint; plus whenever you park the car it takes about 3 seconds to take it down and stash it under the seat. They come with about 6' of cable which you plug into the scanner. A side benefit... you can use it for a CB, ham radio etc., as it uses the radio's "stock" antenna. It's Radio Shack Cat.#: 20-023, $14.99. See it at http://makeashorterlink.com/?B52112FA (give the page a few seconds to redirect you)... the "low-tech" instruction page is at http://support.radioshack.com/support_electronics/doc47/47964.htm

If you feel the urge for a mag mount antenna, my recommendation would be Radio Shack Cat.#: 20-032 for about 30 bucks... it's a good, all-frequency scanner antenna, especially if you'll be listening to all bands... see it at http://makeashorterlink.com/?M14135FA

HTH...

>actually used one and if so how was the quality.

There are two kinds of products that are advertised as cell antennas.

One is a modestly impressive looking sticker that you put under the
battery in a cell phone to improve reception. I'm no expert, but IMHO
those do no good other than to lighten your wallet.

The other is cell antennas themselves, which come in a variety of
styles and connections. Since cell frequencies are in the middle of
the 800 MHz band, people with an interest in 800 MHz stuff (like
trunking systems) will use those on their scanners.

But there is nothing that will enable a scanner to pick up frequencies
that it is not built to receive.

I see you've already gotten the "Listening to cell is illegal in the
US" lecture. Those laws are getting tighter and tighter.

Source record: 49470

I'm tired of burning through regular AA batteries in my PRO-93 - Looking for recommendations for the best choice for AA rechargables for this radio, and recommended vendors, if applicable.

E-mail directly or post - TIA!

I use Radio Shack NiMH batteries in my PRO-92. 1600mAHr, if I remember correctly. I recharge them overnight in the radio. Typical cycle is 14 hour overnight charge, 10 hour usage, per day

They work very well!

Walt

1957. Mobile antenna noise (update)BC760

Newsgroup: rec.radio.scanner
Date: 2002-04-14 22:19:54 UTC
From: magnum44nc@aol.comspamsux
Message-ID: <20020414181954.00788.00005037@mb-bg.aol.com>
Source record: 49473

OK...The last post got good response,but there seems to be some misunderstandings....Probably I didnt explain things in enough detail..... (Thanks for all the previous helpful replys).....

Its a Bearcat760 XLT.....The noise I seem to get is a raspy,popping sound...It is not..I repeat..NOT...In time with the alternator...Meaning as the engine revs faster,the noise does not necessarily increase....It is not like the whine You get from a CB,and then if You turn on thr ANL/NB,it goes away...It is just a popping,snappy sort of noise...It only happens when the car in ON..And MOVING....The faster the car goes,it seems the noise worsens....
The antenna is a stick on the glass ratshack antenna with a 16(maybe 17) foot piece of premade coax.....For what its worth,the WEATHER band I receive at around 162 MHZ,is clear and clean...And I am 40 miles away from the broadcast center...But higher up,800-900 MHZ,the noise is most prominent...
I suspect it is the crappy antenna,as previous posts said...I will buy a new trunk mount from scannerworld.com....I think that will solve the problems....I will certainly report back here with updates......Stay tuned.....!!!

I also use the ratshack batteries (1600mAhr), but on the Pro-93, and they
also work fine.

I would just buy the cheapest batteries with the highest capacity. For use
in a radio, I don't think there will be much difference.
If you're using them in a high-drain device like a digital camera, then you
may want to be more picky.

>> ... and the only time you really need to know what the tone is, is if you need to transmit ...

Knowing who uses what tone on which frequency will also tell you if you are hearing your local agency, or an agency not normally heard on the frequency.

Some agencies use multiple tones on the repeater outputs for different repeater sites.

Scanners like the Pro 92 can be set to read the tone, without filtering a particular tone. Great feature for searching, and listening during band enhancements.

Source record: 49479

Andy,

Sorry about Rafman's reply ... he was having a bad day.

I believe Ocean County has a set bandplan for the county fire departments.

The following website might give you some guidance:

http://www.geocities.com/njmatt2004/oceannj.html

The person who has that site might be able to offer more information if you contact him directly.

Another page to check out, once you work through the pop-up ads, is:

http://maxpages.com/frequencies/Ocean_City

This second site has similar information.

From your location, you possibly can't hear a couple of the frequencies Beachwood is licensed for. They have several frequencies licensed to the town hall that are low ERP. But fire dispatch should be via the county.

Good luck,

Jeff Multer

Well if you don't know, I'm sure no-one here knows either. The IC-R3 is
merely a toy, albeit an expensive and well performing one. But a
semi-professional handheld scanning receiver like the AR-8200 MK II, or the
Alinco DJ-X2000 it ain't, and no amount of software, free or otherwise, is
going to make it one. As the saying goes, 'You can't make a silk purse out
of a sow's ear', and the IC-R3 is most definitely in the latter category.
Sorry.

Cleaning out the shack.

Looking for a new home is an original Optiscan SBE-12SM card-programmable
scanning receiver.

You can see a photo of this receiver at
http://www3.telus.net/gary-jacek/Optiscan.html

You can also download free software to assist you in preparing the
included program card for your local listening frequencies.

This receiver operates normally except that the squelch opens
only momentarily when a frequency of interest comes active.

I don't have the wherewithall to fix it, so I am offering it
FREE to the first person who wants it badly enough to pay
the postage. Be warned, this collectible weighs a good 8 or 10 pounds.

FREE to anyone who will pay the postage.

ve7ggj@rac.ca

I'd appreciate help from any of you scanner guru's out there. I have been doing a lot of research and have been unable to find a scanner that will do what I want for a reasonable price.

I'm looking for a scanner that is unblocked or has a mod to be unblocked, DC to 1.3GHz or above, without any gaps--I especially want to receive 219-225 MHz.

Trunking is optional and not terribly important to me.

Is AOR my best bet, or is there anything else out there?

TIA

Bart

1979. PC Programming for Radio Shack Pro-76, Pro-79, Pro-89, Pro-2016 and Pro-2017

Newsgroup: rec.radio.scanner
Date: 2002-04-15 09:08:24 UTC

I'm looking for any information anyone might have about the pc programming protocol used by the Radio Shack Pro-76, Pro-79, Pro-89, Pro-2016 and Pro-2017 handheld scanners. The software included in the "Scanner Data-Loading Software and Cable" package (Radio Shack P/N 20-048) lacks many features and is not compatible with Windows NT-based operating systems (Windows NT, Windows 2000, Windows XP). If I can figure out the protocol, I can write a program with more features and better compatability.

So far, I have figured out the wiring of the cable, and have an idea of the general structure of the data. I really need help figuring out what appears to be a CRC value. I've been using a program called Slurp to capture the data from Radio Shack's program running on another computer through a null-modem cable.

Here's the information I have about the cable:

The scanner end is a standard stereo phono connecter that goes into the headphone jack. The PC end is a standard female DB9 connector. The sleeve (bottom section) of the phono connector is the ground and is connected to pin 5 of the DB9 connector. The ring (middle section) of the phono connector is RXD (receive data) for the scanner and is connected to pin 3 of the DB9 connector which is TXD (transfer data) for the PC. The tip (top section) of the phono connector is mono audio for when headphones are connected and is not connected to the PC end of the cable. The serial connection settings are 4800 bps, 8 data bits, no parity, 2 stop bits, no flow control.

I have gathered some information about the actual protocol, but it is too lengthy to include in this message.

PLEASE E-Mail me if you have any information or would like to help.

I think what the brother is asking about is a converter box. I've got one laying around somewhere that will convert downward 400Mhz that I built from a kit. I think you could buy one already built that had a BNC fitting and would attach directly to the top of a portable, and your antenna into it. Worked fairly well.

Hi George...
I think your web site is an amazing benefit to all who enjoy the hobby of scanning and I appreciate the hard work you have obviously put into creating it... but I have to say George if I was making over $5000 a week on ebay I wouldn't be complaining about an antenna mast costing $500... especially since I paid much more for mine... You have to be prepared to pay for quality. Just my humble opinion sorry.

Jesse,

The correct frequency is 155.250 MHz. West Seneca (Erie County) uses a tone of 162.2 Hz on their channel, and Lockport uses a tone of 151.4 Hz on their channel.

Dave / NF2G has an excellent web site, providing alot of frequency and tone information for the State of N.Y., by county. He also lists three digital channels in the 420 MHz band for West Seneca Police.

The address is:
http://nf2g.com/scannist/nys_index.html

If you're using a Uniden 780, you can program the squelch on a particular channel to "open" OR "close" for a specific tone.

Jeff Multer, Fort Mill, S.C.

>> I live in West Seneca NY and they use 155.255 for their primary freq and not far from here, say 30 minutes drive, Lockport uses the exact same freq for their pirmary.
>> They use different PL's and I would like to PL the freq to hear only West Seneca.

Tom: That sounds like what he is describing. I have one that I bought years
ago and this conversation got me to wondering where it was. I looked for it
over the weekend and finally found it.
If I remember correctly, you program frequencies 400Mhz below what you are

trying to listen to, 800.500 would be programmed as 400.500. Later today I think I will see if it still works.

From: Ender <ender--wiggin@SBcox.net>
Message-ID: <ukqlbu4gjfirhf8uhnsuhmembr2mdlh0bi@4ax.com>
Source record: 49407

Has anyone had any luck getting the BC780XLT to trunk track this system? I am interested in monitoring Troop B (Western Mass). I can hear activity, but the 780 will not trunk track. I have the following frequencies entered:

860.7875
859.7875
858.7875
857.7875
852.2625

I got those from this web site:

http://lynx.dac.neu.edu/s/stjohnso/ematrunk/msp/msp.html

Not sure if this is up to date information on the SP system.

I have it set for 800mhz type II. When I hit the trunk button, the M indication for Motorola does not come up. If I hold the trunk button down for a few seconds on each frequency, it does pop up, but then I hear no activity... Any thoughts?

Anyone have a working winscan, trunkstar, or excel file they would be willing to share??

Thanks for any help you can offer.

Ender

Hi George...
I hope I am finding you well... we have a saying here in Ireland which goes, "there is no pockets in a shroud" enjoy your money while you can I have no doubt you work hard for it and $500 (£347) is not a lot of money to most people nowadays.

We are talking less than the price of a good scanner, and at the end of the day the scanner is only as good as the antenna it is hooked up to, I can tell you having a good mast has saved my antenna(s) many times and we don't get the horrible weather conditions you get in the US... sure it rains loads here, but it is the winds that does the damage.

Your other option is to build your own, a friend of mine decided to try this route when building a beam similar to one I was using, I helped him out with all the measurements from mine and gave him the assembly diagrams that came with the antenna, guess what? For him to build the antenna himself would have cost more than it would to buy of the manufacture I did. Needless to say he took the short and cheaper option.

You seem like a man of many talents George I'd have a go pricing the materials or asking an engineering company how much they'd charge you to build a mast to suit your needs, I am not sure they will be much difference in the prices though but it costs nothing to ask around, I wish you well and hope you find a solution of some kind soon.

Good listening and best regards for now.

Thanks for the speedy reply. I have programmed in the suggested
frequency above but have not heard anything (assuming it is not a
trunked frequency). As you mentioned, I simply might be too far away
(located just south of Bradley Field). I will dump in the low band
frequencies to see how they work out. Thanks again.

I use the RT-58 with the PRO-91. It works great. It is comfy after the
3-hour races I have gone to so far. It kills the outside noise real well.
No problems. Remember to use either no antenna or a ultra short one to
reduce the many RF sources you don't want.

Due to uneven terrain MSP-B primarily still uses the low band for most
operations that aren't directly in the Pioneer Valley. Your location,
combined with the fact that local repeaters just may not be in use, could be
factors.

Try 855.1625 and see what happens...email me if you want more help.

Not all hopping is spread spectrum. Not all spread spectrum is
hopping.

Spread spectrum is really just that: It's a modulation technique for
smearing a signal across a wide spectrum. There are several well
known techniques: frequency hopping is one, Direct Sequence is
another, and pseudo random time domain pulsing (also known as UWB) is
a third.

>totally false ..there is NO (read that absolutely NONE) consumer
>scanner ..not even for $5000 that can receive ANY hopping signals

>on a hopping radio would be VERY difficult to integrate properly.

True... BUT:

>Hopping radios , by their very nature , have to have digital voice
>encoding. (phase demodulation of FM signals has certain " native "
>time latencies by design)

No, they don't. AMRAD built FH setups with a pair of Icom IC-2AT
handheld radios back in the early 1980s. They were analog FM signals.
I later built a transmitter for an Experimental STA using direct FM on
the clock for a direct sequence signal.

And by the way, what are those "native time latencies?"

> Trunking radios can track changing channels (which are very slowly

>to work properly. Neither available in ANY scanner ever made)

Most cordless spread spectrum phones don't use frequency hopping.
They use Direct Sequence Spread Spectrum.

>>802.11b is spread spectrum, right? Is it secure? Go to

>phone you use , they , can eavesdrop on it in some fashion or other
>VERY easily. Civilians ..forget about it , ..government ..there is
>nothing you can do to stop them ..other than not use a phone at all.

I like it when people are so gullible that they forget to think
critically. 1) disconnect a spread spectrum phone base. 2) take your
spread spectrum phone with you in the car. 3) Listen. Eventually it
will acquire other bases. You're not as secure as you think.

Besides, to detect a direct sequence signal all you need is to build a
limiter, detect the second or fourth harmonic of the incoming signal
to recapture the carrier, mix this carrier with the DS signal and then
perform a very simple Walsh-Haddmard transform (a sequence version of
the more familiar FFT). This will yield the sequence as a series of
Walsh codes. Re-assemble the code and you'll be ready to sync up and
copy the incoming signal. The whole operation might take a few
seconds with most modern processors, if you have no idea what that
signal might be.

The point I'm making is that the reason we don't see scanners for this
sort of thing is because it's arguably ILLEGAL --just like monitoring
SCA programming without notifying the FM broadcast station first.

>If you have a hopping radio of any kind , not to mention spread
>spectrum ... your conversations are VERY secure from any civilian
>eavesdropping of the radio signal , plain and simple.

From ordinary scanners, yes. From those who really want to listen in?
Hardly.

I doubt ICOM has any available -- the last '9000s had LCD displays
because the CRT was no longer manufactured.

Did Sherwood reverse-engineer the entire CRT module or did it stock up
on CRTs or find a compatible one somewhere?

Digital trunking was a poormans method of making local-goverment communications secure without using expensive encryption capable radios. Think about lots of LG's switched to digital because they wanted to be "unscannable" not for any other features. now that APCO-25 will be clear once uniden releases the digital trunking scanner I expect to see LG's flip the switch on the repeaters and go ASTRO or AEGIS.

Good start.

I don't have any particular interest in those scanners - kind of burned out after doing this kind ofthing for the 64, 92 and a Sportcat. I assume Slurp is the program you got from my page. I am delighted to see you using it to figure out another scanner, rather than just as a stopgap for reading the 93 before proper software was available for that.

The way to attack checksums is pretty much the way you figure out the rest of the sequence. Change the data in one channel by the smallest frequency interval possible. Then look for patterns.

I've encountered two kinds of checksums. One is what was used on the 64 - the numbers (as seen in the text format of the data) were added. The checksum for 123 would thus be 1+2+3 = 6.

The other way is to add the ASCII code values of the numbers. That way the checksum for 123 would be 49+50+51 = 150. I think that adding the ASCII code values (treating the data as a series of integers) is more common.

The Sportcat used that kind of a checksum, and I was surprised to learn that others had decoded everything but that.

Good luck.

From: tucansam@whodis.org
Message-ID: <a9getv$bs4$1@reader1.panix.com>
Source record: 49435

Hi gang.

I just spent a little while surfing dejanews and drummed up a little discussion on my first question and a lot of discussion on my second...

First, any ideas on a mobile scanner "stealth" install? I'd like to find a permanent home in my car for my RS mobile/base scanners. They have to be easily reachable so I can operate them by feel without taking my eyes off the road, but I also want to be able to hide it when I am not in the car. I drive a 1987 POS that wouldn't attract much attention anyhow, but a handful antennas up top just might.

Right now I have two scanners (and eventually two two-way radios) that I'd like to install, ideally. I don't want to cut up or carve the dash, etc., but I was thinking about constructing some sort of mount that swings down under the seat when I am not using the gear (bench seat in the POS model). OTOH, I don't want to spend the next six weekends installing this stuff, I want to get to using it! So any ideas on a hidden-from-view install that doesn't take too much money/material/time would be great.

Second, engine noise. In my research I've found that it can be fixed but its never simple. What I want to know right now is: just how common is it? I mean, is *every* guy out there with a mobile or handheld experiencing some degree of interference and noise? Running off the cig lighter kills my handheld... Off AA batteries is a little better but not much. Of course with the engine off all is perfect. I've read about proper ground, shielded spark plug wires, etc. etc... Seems there is no easy fix?

Thanks.

Jason

These scanners seem to use something similar to that. There appears to be a
subtraction involved though, because increasing one of the values by one
decreases the CRC by one. I'm not sure yet what number is subtracted from
though, so far, it seems to be 254 and 190. I'm not sure under what

circumstances it uses which number to subtract from. I'll keep experimenting though.

Thanks for your help!

I have a problem with a nearby FM radio station. It broadcasts on 101.1 MHz and it plays up with my Yupiteru 7300. I try to listen to a marine channel 156.6 MHz and other air band freqs and the FM station makes my scanner "ghost" (if this is the right word!). The resultant background noise seems to drown out the freqs I am wanting to hear.

The problem varies from point to point around the house. I have built a yagi but this does not seem to help the problem. The gain of the yagi seems to be better than the whip which comes with the scanner but the bacground interference seems to be proportionally greater also.

Can anyone please help?

Phil McCorkell

2026. Scanners take another hit in the news.

Here we go again. Thanks, to a story on CNN this morning (and Alex Jones on shortwave last night, and I'm sure several other places), scanner radios and radio receivers are once again be demonized. Alex Jones largely reported the story from the vantage of protecting your self from the privacy invasion that could ensue if you buy a wireless remote video camera rather than a hard wired unit. Alex rightly reported that these signals could be received by a third party using some commonly available units, (such as ICOM's IC-R3). If your camera is focused on the interior of your house, a passerby with the IC-R3 (et al) can discover information concerning your possessions, personal actions, or for the fun of it look for nudity or sex that might occur in the presence of such a camera. Alex recommended that these cameras be limited for use to the observation of outdoor areas that would be subject to public view anyway.

CNN did the story from the "PRIVACY INVASION" standpoint. WE NEED MORE LAWS, was the essence of the CNN coverage. (More laws = emasculated scanner frequency range and features). CNN stereotyped the perpetrator of these "PRIVACY VIOLATIONS" as being a fat man driving around in his car, using a laptop computer and a magnetic mount external antenna to intercept network communications from various businesses that use wireless systems. CNN segued to video of the interior of a home, with unsuspecting occupants carrying on with their daily life. (Oh the horror!). The commentator from CNN asked the expert that they obtained on these issues (paraphrased) "If I call the police because I suspect that someone is engaged in such activity, what will the police do". The expert replied that the police would most likely do nothing, unless the person is engaged in the interception of actual conversations or is involved in altering or damaging the data that may be available on wireless networks.

The expert also said that the manufactures of such systems must encrypt the signals to prevent their interception (the correct solution). The CNN host replied that he thinks that it is time that the legislators look at this issue. (the asshole solution).

When they're through, we'll only be allowed to receive AM and FM Broadcast, Satellite TV and Radio, that's about it.

Try using the radio's attenuator rather than larger antennas.

A larger antenna will pick up MORE of the offending signal and make it harder for your radio's filters to pull out the one you are trying to receive.

Smaller antennas and attenuators help a lot more than larger antennas or preamps in strong signal locations.

I have the Yaesu VR-500 and the VX-5R, both of which suffer from intermodulation interference (more likely front end overloading). The solution for the VR-500, when the interference occurs, is to use the "attenuator" feature, essentially making the scanner less sensitive overall. The solution for the VX-5R was to send it back to the factory, where it's been for the last 6 weeks, (this is a warranty repair, I'm disappointed in the turn around time (the company moved from one facility to another while my radio was there), so I don't know if there is an effective fix for the VX-5R yet. I live in Pittsburgh Pennsylvania, and there must be a damn cellular tower every 30 feet. Both of these radios have been rated quite good (unless you live in Radio Alley, apparently I do). I suspect you may be experiencing front end overloading. Try the Attenuator feature on your radio to see if you eliminate the problem but still maintain sufficient desired signal strength.

I'm sorry, you mistake me for someone who thinks CNN makes sense.
Very few people I know, liberal, conservative, or any shade in the
middle think CNN is a quality news organization who merits attention.

So they vilify Scanners. Let the soft heads out there believe this
stupidity. If it becomes legislation, I'll fight it, just as I have
with previous legislation. I expect you to do the same.

You could also write them a letter about what a radio is and why this
is a bad idea for them (Dear CNN: How will you ever gather news tips
if you ban scanners?). Even among Journalists, CNN is right down
there near the bottom of the heap. Considering that we're talking
about a group that garners as much respect as politicians and used car
salesmen, that says something.

Quit your whining here and send them an e-mail.

73,

Jake Brodsky, AB3A mailto:frussle@erols.com

I recently errected an antenna in my back yard. Very begnin, for personal wireless use. Yesterday, every ferquency based device in my house stopped working. Cable modem, antenna, hell even the garage doors won't budge. Power in the house is fine. I believe that someone is blasting me, maybe they saw the antenna and want to play. What device could I use to figure out the source of this? Where would I purchase this device? Any help is greatly appreciated.

As George Carlin said so well: "CNN is nothing more than a free P-R
machine for the US Government and military"... :)

Personally I take CNN about as seriously as "The Enquirer" and the
"News of the world". If I want serious news about world events I
usually end up watching the BBC, France 2 or my favorite, listen to
shortwave and catch the BBC, Radio France Internationals, English
service of Radio Deustche Welles, Radio Netherland, even Voice of
Russia. Even VOA on shortwave (which is mostly American propaganda -
nothing wrong with that) is a more serious news source than CNN.

Gives you a more balanced view of the world news than the censored
dictated and extremely skewed news from CNN, NBC, Fox, CBS, ABC and
even here in Canada the CBC, Global or CTV and their news channels.

My 2 cents worth, nothing more. :)

Pat - VE2VFD

Charles,
I too, am impressed overall with the apparent capabilities of AirNav4 and have been looking forward to it since I heard it was to be released. I'm not here to be negative about the product, but merely state the fact that a problem exists. And that problem is REAL and not a result of incompetent users who have "thousands" of programs in the background!

There is a direct link between the downloading of the ACARS Internet Data and the PC freezing/crashing. There are now quite a few people reporting exactly the same fault. Of course as soon as one experiences this sort of thing, one looks at the OBVIOUS causes such as background tasks and anti-virus software. I can tell you that those things are NOT a factor here.

This problem occurs with just "Explorer" and "Systray" running in the task manager. My system is as stable as it has ever been and I have over 20 years computing experience. I build computers, install networks and generally have a high level of technical knowledge. Basically, I'm no newbie and when I say a problem exists, I'm not saying it half-heartedly.

AirNav Systems have written a reply to me tonight and have offered a full refund and state that a patch will be available in around one month's time, so what does that tell you?

Regards,
Tom www.ar3000.info

CNN is losing their credibility daily. If Fox News Channel called for more laws on this, then I would be nervous. The cell phone ban is unconstitutional and if someone challenged it, they would likely win.

The PRO-89 checksum is the two's compliment of the modulo 256 ascii sum of all the bytes in a data line except the header byte and the checksum byte itself. The header is always hex 81 and the checksum is a single byte at the end. I picked a random line from the data dump and verified that this formula works.

Are you sure you can't be persuaded to join in the fun? Be like old times.....

If the FM station is overloading your
scanner, you need a notch filter tuned to attenuate
commercial FM broadcasters. I reviewed 3 such
filters in January 2002 Monitoring Times magazine.

All three filters effectively eliminated FM broadcast
interference at my station:

1) Stridsberg Engineering FLT201A FM Notch Filter (88-108 MHz)
2) PAR Electronics VHFFM filter (88-108 MHz)
3) Grove FTR-100 adjustable notch filter (90-174 MHz adj.)

Cool! How'd you figure that out?

>Are you sure you can't be persuaded to join in the fun? Be like old
>times.....

If I owned one of those scanners, I'd be all over it. I have a
compulsion to figure out almost anything I own that has a serial port.

I worked on the PRO-93 for a while, even though I don't own one and am
umlikely to ever own one. It was a good chance to work with my 92ware
collaborator. Then Don Starr came along, and in a few days figured
out everything we had been beating our heads against the wall on.

My next scanner software thing will be to finish the next version of
92ware, something I've been meaning to do for a bit over a year.

Just curious if there is a scanner out there that covers all frequencies with the obvious exceptions of cell.Is there a purpous to have the CB bands? 54 -108 I believe is all Radio Stations. What are some of the other ranges that are commonly left out and what are they used for. I just saw in another post that the 700 range is TV channels. Thanks for the info.

700 MHz was UHF TV, but is in the process of being converted to public service radio. All UHF TV channels above channel 51 or 52 will be switched to lower channels.

There are lots of scanners which cover essentially DC to 1300 MHz, or so. Check out the AOR, ICOM, or Yaesu adds. Presently, none of them will trunk track, though.

FWIW, Radio Shack sells an FM trap, made for TV reception, that I've used on my scanners in my mobile with satisfactory results. It's their P/N 15-577. The 75 ohm to 50 ohm "mismatch" isn't a problem, and I used a couple of "F" to BNC adapters to convert it to the feedline for my scanner. Try this as a cheap fix, and if you need more filtering, then I'd recommend the Par filter. I've had very good results with their stuff.

Not meaning to distract from the main subject but do I see another state that is having problems with there 800 system? I have noticed that several states that put in 800 are still maintaining their low and or high band systems.

Motorola stuffed this new system down the gullets of politicians that control the purse strings around the country now we have numerous public safety organizations are having serious problems with it. Florida being a flat land state even has problems and the 800 salesman want to see it work in the northern hilly states. It will work, with towers mounted within sight of each other. PA's new PSP system isn't even close to being finished and they are having poblems with the system.

And, assuming the police can figure out how to catch them.

I watched this story too, I think I started yelling at the TV at one
point :-)

I heard that you can't use the internet anymore because the moment you
connect your phone line your credit cards are stolen, your car explodes
and your pet dog is stolen for government experiments. Sound stupid?
People believe it (well, maybe not the part about the dog).

Look, the chances of a local scanner user even picking up a low power
wireless camera - much less caring enough to waste his time figuring out
where it's located - is pretty remote. CNN would have us believe there
are evil scanner users on the other side of the world just waiting for
some poor soul to turn on an unprotected wireless device so they can
steal their privacy.

Whoever wrote this story didn't know what they where talking about, do
what I did - change the channel. And try to ignore the angry mob
outside your house who took the story seriously, then drove past and saw
the antenna on your roof....

I haven't followed the entire thread, and I'm not a big scanner user- more a "lite" user. The question that occurs to me, and perhaps someone else has already caught this, is-"How does an audio-only scanner pick up a video transmission?" I recognize that some of these cameras could have audio capability, and that could/would be transmitted, but so what?

Enjoy getting news at it happens in your area?
How about Listening to police/fire scanners?

Either way NINN (National Incident Notification Network)
is a website for you !!!

NINN is a scanner/news hobbyist web site that tracks and
Alerts subscribers to news, and issues happening
in your area. News can be police pursuits, disturbances, robberies
and much more. There is also live fire reports, accidents and hazmat
notices.

We use volunteers to provide this free service to the public to notify
them of such incidents.
Volunteers log into a dispatch system, and type out the information
which then sends it out to
subscribers. Subscribers can receive the notices on any Email capable
device
(Computer Email, pager, cell phone etc...).

If you are interested in volunteering for your area, or subscribing
visit http://www.ninn.org today.
Best of all its free.

I am putting up a Diamond dual band vertical antenna. It will be for 2m and
70cm with about 60 feet of LMR400 coax never run underground.
My problem is should I buy the antenna with the UHF or the N connector? What
are the pro's and con's to both? Is a UHF the same as a PL259?
And if one connector is better than the other then why is there any choice?
Also I have experience in soldering up PL259's but no experience with N
connectors. Are they hard to solder up to coax?

Hey John:

First, let me say that I'm NOT an expert. When I was interested in ham radio (never became licensed), in the 50's, amateur tv was 'slow-scan', not like you watch on tv. You would need a modified tv to view it. A scanner is tuned to a single frequency; broadcast tv (don't know about amateur) requires a 'channel' (frequency range) to receive the audio/video portions (about 6mhz wide).

Lot's of other details needed. Maybe some hams can weigh in.

Hank

If you have a TV card in your computer AND your local ATV'ers are running on
421.25 megs you can tune the card to cable channel 57 and pick them up.
Remember,
that's CABLE channel 57, not over the air (but you still use an antenna as
opposed
to hooking up to cable tv)......

AFAIK your scanner is useless for this application except for monitoring the
audio
channel (4.5mhz above the video freq and running WFM).

The N connector is a constant impedance, where the UHF, or PL259 is not.
Especially if you're going to run some power on 70 cm, the N is preferable,
moreso at higher frequencies.
Why are there so many connectors? I dunno. The history probably involes the
military.
My Collins S-Line uses RCA connectors at the 100W level and N connectors at
high power.
N connectors are no more difficult to assemble than PL259 (UHF) connectors

Just an update...

I was sent a specification for the scanner protocol and have been able to use it to write an object oriented communications backend for my program. It can now successfully send commands to the scanner. I'm going to finish making each of the scanner commands object oriented, and then I'll start working on the user interface.

For this app, either will work OK.

> What are the pro's and con's to both?

The N connector is a constant impedance, waterproof connector. The UHF
(PL-259) is neither, although proper preperation and installation of the
UHF connector minimizes these issues considerably. Again, for your use, it
doesn't make a lot of difference either way.

> Is a UHF the same as a PL259?

Yes

> And if one connector is better than the other then why is there any
choice?

Because choice is good ... :>) (and they sell to a global market, where the
standards can vary)

> Also I have experience in soldering up PL259's but no experience with N
> connectors. Are they hard to solder up to coax?
>

Not harder to solder, just requires more precision. The coax has to be cut
and prepped to exactly the correct lengths or the connector does not
assemble properly. And the soldering requires more precision, especially on
attaching the tip. Too much/sloppy solder and it won't go into the
connector body correctly.

I use UHF connectors for 2/440 and have no problems with impedance or
excessive loss, or moisture. Above 440, I use N connectors for their
impedance and loss advantages at higher frequencies, as well as
convenience - because this is the typical connector on antennas and
transmitters for these higher frequencies.

I listen to the Police & 911 dispatch frequencies, and they always make reference to other channels by name, "Go to Fire-2", and "Go to Government-3", but I don't know what these are, and the big thick RadioShack book doesn't say.

Also, I've latched onto a chanel that seems to have just one-sided conversations on it Rx and Tx on different frequencies - I think think might be "Fire-2" but don't know....

Oh, I'm under the flightpath of one of the runways for BWI airport. What ground-to-air frequencies to they use?

>

I don't know much or really anything about Disney's channels. So far as I am aware WDW Security's radio system is still analog. They will be migrating to a digital system soon and there are rumors of their doing completely away with radios and issuing Nextel's to all their security hosts sometime in the not too distant future. These are just rumors I've heard. Reedy Creek Fire and Disney systems are completely separate since we went digital, and I know next to nothing about Disney's system.

All of Reedy Creek Emergency Services has transitioned to the new Astro digital system. The new system went live Tuesday morning, December 18, 2001. We do still simulcast on 453.825 since there are some Walt Disney World Company entities for which that is the only way they have of monitoring our tone-outs. There are plans afoot to do away with that, too, but I don't know how firm those plans are. With that channel, you will only hear our original station tone-outs. We don't transmit anything else over it. En route tactical channels and fire ground channels are all digital. The only other channel that isn't digital is the one used by the fire-safety inspectors who use it to coordinate fire code compliance operations. That will soon be digital, also.

2093. AOR 300OA and antenna question(s).

Newsgroup: rec.radio.scanner
Date: 2002-04-17 22:32:35 UTC
From: BA <baut83@earthlink.net>
Message-ID: <B8E36F65.12DF%baut83@earthlink.net>
Source record: 49309

I have an AOR 300oA. I live in a condo. And I'm looking for
some accessories. And advise. Any helpful input would be greatly
appreciated:

Questions:
-When I desire to use it as a base unit. And desire to cover basically its
entire range. Is the AOR SA7000 an acceptable or better than acceptable
antenna? Note: I need something fairly inconspicuous.
-If I obtain this antenna, should I or should I not mount it directly to
the top of the metal railing atop my deck?
-Has anyone designed or is aware of a designer/manufacturer of custom
portable cases for the 3000A like Electronic Equipment Bank used to
offer?
-Same question regarding a battery power source for same.
-Recommendations for a spectrum analyzer for the 3000A.
-Recommended software?

I apologixe for cramming so many inquiries into one post. Parkinson's
Disease has slowed my typing ability to a snail's pace. This way was the
only efficient way.

Thank you for any suggestions you may have. I thank you in advance.

You can respond to me directly if you so desire.

Regards.

BA

PL-259 = "UHF" connectors ... a misnomer if there ever was one.

"N" connectors are designed for higher frequencies ... they are
"constant impedance" (they maintain 50 Ohms throughout and
thus don't make an impedance "bump" ... IF they are put together
correctly.)

I wouldn't use a PL-259 for anything above 6m myself, given a
choice (yes, I know that most 2m rigs and some 70 cm rigs come
with those connectors ... but I'd be willing to spend another buck
or two for the better "N" connectors if there was a choice ...)

The choice is based mostly on cost ... plain and simple ... N's
are more expensive than PL-259s ... and different, but not
exactly more difficult to assemble properly ... PL-259s can
be put together badly, too (and often are ...).

If it were me, I'd definitely spring for the N connector on a
2m/70cm dual band antenna ...

Tom,

Thanks for you kind reply.
I can report here that all still works really well, without any
problem.
I'm working with ACARS Data (using their ACARS Decoder) and Internet
data also.
Any software may have problems or incompatibilities with some systems,
and if it works really well here and not there, that could be the
case.

> AirNav Systems have written a reply to me tonight and have offered a full
> refund and state that a patch will be available in around one month's time,
> so what does that tell you?

It only says what I've been saying. Opposite to what has been posted
in some newsgroups their service is outstanding! If you reported a
problem they couldn't do any better: offered a refund and will release
a patch soon for users that experienced problems.

What else could a user want from a Software Company?
I believe not even 10 out of 100 companies would offer you a full
refund for that.

Hope you will get the program working soon as I'm sure you will like
it.

Charles, EGLL

Most likely, that one sided conversation is the input to a repeater. You
were either too far away to hear the other party or the dispatcher
simply broadcasts on the output side which has a lot more power that 5w.
For a possible ID on the others, look at www.cityfreq.com and/or
www.n2fg.com.

For our county we just switched from Moto analog 800 to the Astro Digital. Absolute chaos, extremely poor radio traffic, many millions of dollars spent on this mess. I am a user of the system, both police and fire, street level in both cases. I am outraged and incensed at the performance of this vendor. Is there even the slightest possibility of the difference in radio communications reference IMBE and VSELP?? We are desperate in solving this, your qualified responses will save the lives of fire and/or police as well as the general public.
Stay tuned, this "system" may be your next one too. Thanks in advance for reading this and any constructive replies regarding the IMBE and VSELP differences.

Do yourself a favor and avoid N connectors whenever possible. I know,
the purists will say they are better, and of course they are - a little,
not a lot. Not enough better to justify the extra cost and hassle. Yes,
they are a hassle. Almost no one does an acceptable job of installing
their first N connector. If you ever installed one with the center pin
even slightly off exact center, which usually results in breaking off a
segment of the receptacle in the female center, which then results in
the job of replacing not only the misinstalled N connector you just
messed up, but also changing out the N female assembly as well- a near
impossibility on some devices such as antennas- you'll understand why
General Electric used UHF/PL259's exclusively throughout their Master II
line of UHF gear, among others.
Some newer connectors are easier to install correctly and better than
older versions. How do you know which version you are buying? Is it an
"easy" one or not? There are an awful lot of "older" ones still out
there on the market.
The *small* advantage of N connectors over PL259/UHF types through
around 500 mhz is just not worth it.

> We are desperate in solving this, your qualified responses will save
>the lives of fire and/or police as well as the general public.

Here in San Diego, California, the County installed a digital Astro system a few years ago, with all law enforcement being digital, and all other services being analog.

When a Sheriff's unit can't be understood by the SO dispatchers, they simply say "You went digital ", and everyone knows what they mean.

No, it CAN'T be fixed, without completely redesigning the system.

To reply by email, remove the XYZ.

Went nuts with my scanner, and ran the spectrum from 36Mhz to 512, minus normal NTSC air b'cast freqs. I saw some strange things on strange freqs -- I'm near Baltimore, MD. Am I picking up audio channels from the HDTV assigned freqs, or is my coax leaking CATV signals?

446.812........WNUV CH.54 Baltimore (Audio)

450.137.......WBAL CH.11 Baltimore (Audio)

471.837.......WBAL CH.11 Baltimore (Audio)

511.762.......WDCA CH.20 Washington DC (Audio)

497.437 and
475.737..........Misc. unknown Spanish-speaking channel

These frequencies don't match the normal air-frequencies for the given channels. Whats up?

Pardon my scepticism, but couldn't it also prove that Mr. AirNav is becoming
aware of the poor publicity his most recent offering is getting on
newsgroups such as this, and has finally decided to actually provide
after-sales service, something he has been loathe to do in the past?

I'll take a shot at a them...

>
> 446.812.....WNUV CH.54 Baltimore (Audio) -------- ?????? probably
some kind of "image" or harmonic?

>
> 450.137.....WBAL CH.11 Baltimore (Audio) ------- that's a legit
"BA" remote broadcast pickup frequency, probably belongs there; stations
will often broadcast their audio on some of their 2-way frequencies;
useful during newscasts when they're gonna chat live with a reporter in
the field... they'll often just leave the thing on for the heck of it...
or for their engineers who may be out working on stuff

>
> 471.837.....WBAL CH.11 Baltimore (Audio) ------- undoubtedly this
is an image of the previous freq, generated within your receiver... the
scanner's IF is probably10.85 (a typical IF for uniden/bearcat and some
others), and dual-conversion receivers will give you images at DOUBLE
the IF (2 x 10.85 = 21.7) above or below the actual frequency. 450.1375
+ 21.7 = 471.8375

>
> 511.762.....WDCA CH.20 Washington DC (Audio) - ----- this one's
easy: UHF-TV channel 20's audio frequency is 511.75, wiide-band FM...
.511.7625 is plenty close enough; I believe all TV channel audio freqs
are at .750 of their uppermost freq.
For example, TV Channel 20 goes from 506-512 MHz, with its audio at
511.75. TV channel 6 goes from 82-88 MHz, with audio at 87.75. If
you're in an area served by TV channel 6, you should be able to listen
to it on any FM radio that can tune down to 87.75 or 87.8 or so. Again,
it's wideband audio, not narrowband like 2-way stuff, so it won't be as
sharp

>
> 497.437 and don't know about THAT

> 475.737.....Misc. unknown Spanish-speaking channel; -------
again, that's probably the audio for TV channel 14, 475.75; channel 14
is 470-476 MHz.
>
> These frequencies don't match the normal air-frequencies for the given
> channels. Whats up?

I personally think N connectors are eaiser to install. You don't need a gazillion Watt solder gun to heat up the shell to solder the braid, thus melting the plastic outer sheath on RG-8. With N connectors, the braid is clamped to the shell by the rear nut. The onlt soldering needed is the center pin...if you go heavy with the solder, carefullu trim it off the outside of the pin with an exacto knife or utility knife (sharp) and you're good to go. To prove which connector is better, use a TDR (Time Domain Reflectometer) and look at the impedance bump of each type of connector. You will see the N is better. Like all connectors, it just takes practice like most other things in ham radio.

PROTEST!
========
The *small* advantage is valid only, and only when the UHF
connector is mounted at the coaxial cable *the correct way*.

It is not more difficult to mount a N-connector than an UHF.
It is HARDER to make a PROPER UHF-connector installation than
a corresponding N one. I've seen real TERRIBLE installations of
UHF-connectors. The problem is, You can install the UHF in a
Quick-and Dirty way, and You will have SOME fuctionallity, for

SOME time, still. A N-connector can be installed correctly, or it will not work (or breakdown). Installation of a N-connector is self-explanatory, PROPER installation of UHF needs EDUCATON. For an outdoor applocation such as an antenna connection, if You choose UHF, You'll have to make sure it is correctly done.

UHF-connectors should be forbidden in law. I'ts one of the worst inventions ever made. They ARE hard to install the correct way (You DO need a soldering iron > 75W, It is hard to be sure You got a good enough braid connection, You are more-or-less BOUND to do damage to the cable if You do not know the EXACT amount of heat that should be applicated by the soldering iron. Etc. Etc.)

2109. Vaesu VR-500 undocumented narrow AM mode, other features

Newsgroup: rec.radio.scanner
Date: 2002-04-18 11:56:32 UTC
From: Bob_Parnass_AJ9S <parnass@megsinet.net>
Message-ID: <3cbeb482$0$30317$272ea4a1@news.execpc.com>
Source record: 49325
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave

The Yaesu VR-500 portable receiver contains an undocumented narrow
AM mode which is more selective than the "stock" bandwidth. There
are other undocumented features in the VR-500 but the purpose
of some of them remain a mystery, e.g, a "USER PORT" menu.

You can enable the NAM mode and USER PORT menu
using the tk500 experimental VR-500 programming utility.

tk500 version 0.3 is now available for free download.

tk500 is an open source programming utility for the
Yaesu VR-500 portable receiver.

Improvements in version 0.3 include the ability to
exploit undocumented features within the VR-500 and
choose a NAM (Narrow AM) mode.

The new version supports editing of the VFO skip channels,
enhance error recovery, adjustable display contrast,
and additional features.

tk500 has a graphical user interface and runs on Linux
and Windows. I'm still looking for MacOS X beta testers
familiar with Tcl/Tk.

You can learn about and download a beta test version of tk500
from my home page:

http://members.core.com/~parnass

I don't warrant the software, though it will cost you nothing.

Thanks to Paul Martin, N8ULS for providing experimental data and
to Dan Wanchic, WA8VZQ for posting detailed
information about the RDF file layout.

N type PRO: Attaches the braid with a clamp, not solder. There's much
les risk of damage to the dielectric.

N type PRO: More weather resistant.

N type CON: Must strip and trim the cable accurately, or else the
center pin won't seat properly. That causes most of the trouble in N
type connectors.

N type CON: It costs more, but then again so does the LMR cable!

Losses: Not enough to worry about IF the PL-259 is of good quality,
properly attached (good soldering, especially), and you're not running
high power.

Putting all the legal crap aside. Will it be possible for the new digital scanner to be able to receive the non spread spectrum digital cordless phone conversation if the 900's are not blocked?

That would probably be runway 10 (You live in or near the east side of
Columbia, right?).

Usually the approach frequency for that sector is 128.7, the tower is
119.4, Air Traffic Information Service (ATIS) is on 127.8 and also on
115.1 (BAL VORTAC).

If you only hear pilots it's because your antenna isn't high enough.
Air traffic control radio systems work on simplex AM. They use
relatively low power because they have nearly line of sight
communications in almost all circumstances. Since the band is crowded
and frequency re-use is an issue, there is very little incentive to
use more power than 100 watts. Most of the time, they use far less.

I use the RS NiMH's for my Pro-94 and IC-R2 (and Palm III, FWIW). They work fine, and last awhile. Have 2 sets of batts for each, when they need recharging, just pop in the charged backups and throw the empties in the charger. Bought a RS charger that does NiCad and NiMH, does 4 at a time, and takes AAA, AA, C, D, and 9V. Works for me.

Damn. I remembered wrong. Approach control is on 119.7 for the ILS
10 approach. You may also hear BWI ground controllers on 121.9 and if
you're really, really curious about such things: Clearance Delivery is
118.05.

Just so that you understand what you're hearing in relation to this
approach: The Instrument Landing System (ILS) has an Initial Approach
Fix (IAF) called DATED. The Localizer intercept fix is called COLUM
(10.4 miles from the BAL VORTAC) at which you're supposed to be no
lower than 2500 MSL. The middle of the course has another fix called
JEANS and it's 5.1 miles from BAL. The missed approach takes you to a
holding pattern 11 miles East of BAL at intersection BOAST.

If you want more data, go purchase a copy of the NE-3 U.S. Terminal
Procedures book from a local airport. It has all the gory details.

The UHF is the same as a PL-259.The N is harder to solder than the UHF. If you practice with one or two on a juck piece of coax, then put one on your coax, go with the N. In antennas for comercial equpi. they use N. If I could I put N on my equip.

>Losses: Not enough to worry about IF the PL-259 is of good quality,

There you go. If you buy crap PL-259's they have loss. I bet you can buy cheap knock off N connectors made in some Indonesian sweat shop that have the same losses. Why people will spend big $ on an antenna, a support structure and coax that has .05 db less loss per 100 feet and then use a connector they bought in a box of junk at a hamfest never ceases to amaze me. A top grade teflon PL-259 combination (the socket counts too) really doesn't get very lossy until you hit 4.3GHZ, and I've gotten away with them there in a pinch....
Even an RCA connector can be made fairly low loss at VHF and low UHF with good dielectrics....

No problem, just use the FCC's license records website.
http://gullfoss2.fcc.gov/cgi-bin/ws.exe/genmen/index.hts

For example, I was able to find my local police frequences (4 of them):
http://gullfoss2.fcc.gov/cgi-bin/ws.exe/genmen/uls/uls_freq_res.hts?db_id=19
&link=14032189&key=0&callsign=KH380

I read a test report in which the author compared UHF and N connectors on a network analyzer. I was surprised at how bad the UHF connector actually is at UHF...he measured about 1 dB insertion loss per UHF connector vs. about 0.2 dB loss per N connector at 440 MHz. Add the loss of the coax at UHF to twice the insertion loss, and you've cut your effective power in half! Yikes!

I found this article enlightening:

I always found that the easiest way to solder them was with a
resistance soldering "Iron" (More like carbon tweezers). I don't have
a set at home (Bummer)

Was the insertion loss due to mismatch or to actual dissipative loss? If it's mismatch, the "loss" can be eliminated by a matching network.

Here's an example to show the difference. Suppose the connector is right at the load, and that the generator is set up to provide 10 volts RMS (2 W) to a 50 ohm load. The generator voltage is then 20 volts RMS. If the connector's impedance at the test frequency is a resistance of 12.2 ohms, the load will see 50/112.2 * 20 = 8.91 volts RMS, a reduction of 1 dB from the 10 volts it would have gotten without the connector. If this is happening, the connector loss is truly 1 dB, and the loss can't be recovered. But on the other hand, suppose that the connector's impedance is a pure reactance of 50.9 ohms. The load will see 100/(sqrt(100^2 + 50.9^2)) = 8.91 volts RMS just like it did with a resistive connector impedance. So the "insertion loss" is 1 dB, just the same as for the resistive connector. But this is different. We can make the insertion "loss" disappear entirely simply by adding a series reactance of the opposite sign at the connector. This cancels out the reactance, and the load gets its full 10 volts RMS (2 watts). This second case shows the effect of, and cure for, the impedance "bump" caused by a connector that doesn't have the correct constant internal impedance. In many cases, you'll have a matching network anyway, so you can adjust out the effect of the impedance bump with minimal degradation to your system. (The only possible degradation is a slight increase in the SWR on the transmission line, if the mismatch is at the antenna and the matching is done at the transmitter. The increased SWR could lead to increased loss if the line is quite lossy to begin with and the SWR increase is appreciable.) A UHF connector with Teflon insulation isn't likely to have much resistive loss -- measured "insertion loss" is more likely due to impedance mismatch.

"Insertion loss" is similar to the concept of "mismatch loss" or "reflection loss". I recently wrote about those in the thread "Suggest coax for long run" in rec.radio.amateur.antenna, on March 27 and April 10. You should be able to find these at http://groups.google.com. There was also some discussion recently about misapplying modeling results to reach invalid conclusions. If a measurement is made of a connector's "insertion loss" and it's taken to imply that it represents real dissipative loss, then this could be a good example of that misapplication being done.

Roy Lewallen, W7EL

I see a lot of responses to the UHF-N question and I'll add my $.02.

UHF connectors were designed when UHF was considered to be anything
about 30 MHz. Currently the connectors come with a wide variation in
quality. If you are determined to use an UHF connector get ones with
teflon dielectric. I have seen them with nylon dielectric which will
melt with moderate power at even 2M. Nylon is very lossy but is cheap
compared to teflon. I find that it takes longer to properly assemble
an UHF connector than an N. There is one solder connection on the N and
two wrenches are required to finish the assembly. The N connector will
have good dielectric material unless you are able to find a really off
brand source.

The other thing you need to consider is the loss of LMR400. If you are
planning a run over 50 feet you might consider something like 9913.

Actually, it's rated to 200 watts on the amateur bands.

I use one with 60 feet of rg-213 coax and have very good results from
30-900Mhz

I don't seem to be getting such good receive on 800Mhz though... Might need
an antenna with some gain to get better reception on this band, but for what
I use it for, it's fine.

There are plenty of scanners available even today with no blocked
frequencies and haven't been modified. For example, I have an Icom
R-100 which covers from 100KHz, (which is below the AM broadcast
band), to 1856MHz. There are no gaps or anything blocked out. It
receives AM, FM, and WFM and is a sweet little radio. These are often
available "new in the box" on Ebay for around $300.00 but I found mine
at a swapmeet for $10.00 It was missing the AC adapter and had 2
broken antenna jacks but what the hey.

Don't these have roughly the same loss?

2150. Six Mil-Comms Capable and Trunk Tracking Scanners for Sale

Newsgroup: rec.radio.scanner
Date: 2002-04-19 05:00:05 UTC
From: allanstern@aol.com
Message-ID: <20020419010005.08009.00004055@mb-cr.aol.com>
Source record: 49266

ITEMS FOR SALE

BC9000XLT: Base Model; 500Ch; 20Banks; 25-550 MHz, 760-1300 MHz; Data Skip; AM/NFM/WFM Mode Switch; Adjustable Step Width; Antenna Attenuator; Alpha Numeric LCD Display. Monitors both UHF and VHF Mil comms.
Recent EBay sale: $265.49 + ship.
Price: $190 shipped ($180 picked up). 4 units for sale.

BC895XLT: Trunk Tracker; Base Model; 300Ch; 10banks; 29-54, 108-174, 216-512; to 956 MHz. Moto TT; 100cps TurboScan; 300cps Search; Tuning Knob; Data Skip; 12 Priority Channels; RS-232 Cmptr port; Aux/Tape Output; Signal Strength Meter; Weather Alert; AutoStore skips dupes. Monitors UHF Mil comms. Recent EBay sale: $219.00 + ship, and 182.50 + ship. Current Grove price: $195.00 + ship.
Price: $135 shipped ($125 picked up). 2 units for sale.

My friend in Orlando, Harold McNeal, is selling six more scanners, that were not on the previous list I posted. These are Mil Comms capable, and two are Trunk Trackers. They are in top, like new condition. He has priced them low.
1. Price includes shipping to any CONUS address.
2. Price includes wall wart power supply or power cord.
3. Price includes manual and indoor antenna.
4. Radio will be shipped upon receipt of US Postal Money Order.
I prefer that you contact Harold directly, in Orlando, at 407/852-0693 (new number) to arrange to mail him the payment. If he is not at home, leave your number of call again until you reach him. I will be glad to answer any questions if you want to contact me at 321/777-2018.

Sounds like a very top notch little gadget. I did notice though, that you
didn't mention anything about any possiblity of scanning trunking systems,
or putting ctcss capabilities in it. I think that's pretty much all it's
missing.

Btw, how much Canadian does that translate to.

Very cool, but I think some of the features might be constrained by the battery (using flash instead of a disk would help -- I don't think you would need GBs of storage on the scanner). Bluetooth also might interfere with the receiver.

There seems to be no decimal point (or comma for parts of Europe) on the keypad for the search tab.

Intefacing to a cell phone (via bluetooth or USB) would also be cool. When travelling, you could link it to the internet and download local frequencies. Don't forget interfacing to other palm scanners for cloning.

Since you already have a database, having functions to autostore active frequencies would be cool. Also, some type of macro language would really rock.

A dock that gives extra features like discriminator output and recharge, etc. would be a nice addition.

If you have a pocket PC (or palm, but I'm a PPC kind of guy), you could make a working prototype. Code up the interface for the PPC then buy a compact flash RS-232 card for the PPC. Then you can control a scanner like the 780 using your interface and see how it really feels. Kind of expensive, esp. for a college student, but you can download the compilers and PPC emulator from Microsoft for free to get it working and maybe borrow a PPC or something if you don't have one. Even if you don't actually get a PPC and hook it up to a scanner, you can prototype the interface with the emulator.

Cool idea! You did a great job.

Yes, another request. For my mother. Really.

She currently has a BC 210XLT. She got it to listen to police calls, since my brother's a cop, and whenever she
hears of local incident, or just on in the evenings. She's complaining that it doesn't work as well as it used to.

My translation is she just wants a new one.

Whipping out the Universal catalog (I like SWL/AM DXing), there's the BC-278CLT as my starting point. Radio Shack has stuff on sale for another week or so.

Is there any place to get reviews like Radio Netherlands? Or will the above do as an easy upgrade?
It adds AM/FM/SAME WX, PSB, and I think the Aircrat band. (She also lives next to the town with the airport.)

TIA

The latest report is that the train was going 65 MPH and the engineer
hit the emergency brakes because he say "something" on the track.

Now my question is that what in the hell is so important for a 65 MPH,
23 car train to hit the emergency breaks? When there are cars at a
R/R crossing they don't hit the breaks, the just blow the horn and keep
on trucking..... To prove this ironic point, a few months ago in the
very same area (within 10 miles) of this point of derailment another
train hit a car at a R/R crossing draging it for nearly a mile. All in
the car were killed. That isn't the only car to be hit in this area
either....

Well, as a general rule, the crossings seem to be located in areas where the train engineer can't see the crossing until it's too late to stop. It takes several miles to bring a train to a stop. It's not that the engineer doesn't hit the brakes when he sees the car, there just isn't time for it to have any effect.

A common misconception... UHF (the connector) does not mean Ultra
High Frequency, it means Universal HF, as in "good for all uses
between 3 and 30 MHz". Of course, the definition of 'good' is
debatable in this case.

As I recall the story, N, BNC, TNC, and C were all designed by the
same two guys, Mr. 'N' and Mr. 'C'. Sorry, can't remember their
names or where they worked (Bell Labs?). Perhaps someone else does?

I've never had any trouble putting N connectors on. Keeping them
on...thats another story, at least on cable with braided sheild. They
can not stand much flexing. If you are using one on a rotating
antenna, make sure that you have the cable clamped so there is no
movement what so ever at the connector.

2171. Pro 2035 scanner

Newsgroup: rec.radio.scanner
Date: 2002-04-19 18:42:10 UTC
From: Oldgeek <oldgeek@home.net>
Message-ID: <Xns91F58BC9E53A4oldgeek@140.99.99.130>
Source record: 49287

Hi,

I have a Pro-2035 scanner with box and manual I would like to sale or trade. This scanner has the module that blocks the 800 mhz replaced with the European module. I would be interested in trading for computer parts or a decent guitar. Made offer on cash.

Thanks

2172. ARC780 via PayPal

Newsgroup: rec.radio.scanner
Date: 2002-04-19 18:46:39 UTC
From: Thomas J Owens <meteo@nospam>
Message-ID: <Pine.SGI.4.30.0204191442580.6169-100000@world.std.com>
Source record: 49288

Have any of you registered ARC780 via PayPal? I don't seem to be having
much luck getting a response from butel since I submitted payment on 4/13.
Do they usually take a while to respond? Thanks in advance.

Tommy

2173. FS / Trade BC760XLT with CTCSS

Message-ID: <20020419144849.04399.00007376@mb-fi.aol.com>
Source record: 49289

I've got an older Bearcat with some useful 800 to 950 range freq's. It's also got the optional CTCSS board.

Make offer (a reasonable one)

Will trade for Motorola RSS programmable VHF, including minitor III's or toward a 780XLT

Please reply without the spamblock to:

Oh yes, I forgot, some of you Americans pay ridiculous prices for these scanners, here in the UK, you can get mint 2006's for around £75.00. as I have shown here on the group before. Only last month I bought a mint, boxed,unblocked Aor AR8200MKII with software/cable for PC for £100.00 .($145.00 US) I saw one the same on the US Ebay page for $515.00 US Dollars. Your crazy you yanks :-))
I will get one for you if you want.....

In the UK the 2.3 to 2.5GHz band also has a ham radio (video) allocation
and a Police air to ground video allocation, so there are some
interesting uses for the product. Compared to the R3, the R3 is very
deaf (blind!) at 2.4GHz..

It doesn't always take a big object on the tracks to derail a train.
Something much smaller than a car can sometimes start a derailment. The
engineer may have seen an object that caused him to make a split second
judgment about the possibility of a derailment and he decided that
applying the brakes was the best response.

They were designed by Paul Neil and Carl Concelman of Bell Labs. The BNC is a 'Bayonet Neil-Concelman', and the TNC is a 'Threaded Neil-Concelman'. And yes, the Type-N and Type-C connectors come from the first letter of their last names.

2192. Automotive interference

Newsgroup: rec.radio.scanner
Date: 2002-04-20 01:10:10 UTC
From: tucansam@whodis.org
Message-ID: <a9qf5i$i9v$1@reader1.panix.com>
Source record: 49208

I recently replaced the spark plug wires on my 4-banger, and I did notice a difference in the level of interference that my handheld with a rubber duckie picks up.

I also picked up a cheap mag mount for the roof. I am not expecting miracle reception, but I am now able to pick up noticably distant stations compared to the stock rubber duckie.

The mag mount uses *thin* coax. I've never seen coax this thin except on the short DS3 cables we use in the lab at work. I am sure there is some shielding in there, but I am not convinced there is that much. Is my assumption correct?

I am noticing alternator whine on dead-air channels with the squelch turned down -- when I accelerate, I hear "rrrrrrr" and it gets louder as I step on the accelerator.

With the rubber duckie this problem is less pronounced. I am concluding that the thin/mildly-shielded coax run between the antenna and the scanner is picking up noise.

If this is in fact the case, is there anything I can do, short of a new antenna? Perhaps wrap the in-car portion of the cable in some sort of foil, etc? One of the reasons I bought the antenna was because the cable was so thin. Its going to be a temporary antenna ultimately, but I'll likely use it for 8-12 months, so I'd like to clean up the signal a bit if I could.

Any comments or suggestions would be most welcome!

Thanks.

Jason

Uniden versus Yaesu. Some would think that there is no comparison. Both offer commercial and domestic (amateur) equipment. But one thing, in my mind at least, testifies loudly to the virtue of Uniden is an experience that I have had with both companies concerning the service of a radio manufactured by each company.

I have 4 Yaesu products, purchased in rapid succession (all in a period of 18 months). The VR-500, VX-5R, FRG-100, and the FT-840. The FRG-100 Shortwave receiver is a sweetheart, no problems at all. The FT-840 HAM transceiver with general coverage reception is quite good for my needs also, but I received the unit in a non-functioning condition. I was stymied. I sent it back to AES in Cleveland (great store) and they discovered that the power cord had the positive and negative wires reversed in the plug that connects to the transceiver. This was from the factory. I did not have the pin out; with it I "might" have discovered the problem. This caused me some aggravation in shipping it back to Cleveland and waiting 2 more days for its return. Oh well, I figured I'd write to Yaesu and ask for an explanation. I did, I wrote again and again, and never got a reply from them. I gave up. Enter the VR-500. Very fine receiver, except with the front-end overloading. As I travel through Pittsburgh and approach one of the million or so cell towers here (honestly, people claimed that billboards were cluttering the landscape, billboards pale in comparison to cell towers), the radio's front-end overloads. The fix is to use the Attenuation feature, works reasonably nice. Ok, so I bought the VX-5R, sheesh, I can't even look at a cell tower without it overloading. It doesn't work in many areas where the VR-500 excels. So I called Yaesu technical support, they suggested that intermodulation interference might be a factor and asked me to return it for warranty repairs. I did so in February, they received it March 04. After innumerable calls and e-mails, I finally discovered that it has, just today, been shipped back to me. The radio had been repaired by April 04. It took 2 weeks to ship a radio that had taken 5 weeks (from the original shipping date) to get repaired. Yaesu claims (I am sure that they are truthful, but the delay is too long) that that had just moved to another facility and had great difficulty in getting the shipping department going again. My gripe with Yaesu is that they never write back if you e-mail them (to customer service) with the exception of the repair technicians, they write back fairly quickly. They never call back if you phone them, (customer service) even if they promised to call when they discovered that the radio was ready to ship. I spent some 45 minutes on the phone, waiting for the automated systems to connect me with customer service Reps that had no intention on calling back anyway.

Enter Uniden, another brand of radios that I own that were produced directly (Uniden Products) or indirectly (Radio Shack Brand) by Uniden. I bought the BCT-7 slightly used, and shortly after receiving it began to have trouble with the display illumination. I disassembled the unit, found the offending surface

mounted LEDs, and called Uniden in an attempt to procure new ones. After a rather frustrating volley with the woman in the parts department (who refused to give me her name, and also refused to direct my call to a supervisor when I asked her to), I began to write to various individuals with Uniden Corporation itself. Soon I had a response from a woman with the corporation acknowledging that she desired to help. I wrote to her with the details (concerning the altercation with the woman in the parts department) and she resolved the situation by having me return the unit to Uniden, whereupon Uniden sent me a new unit. I also received a call from the parts department saying that they had found the LEDs that I needed. (I thanked them, but as the unit was being returned for replacement, I no longer needed the LEDs) This is what I call customer service. They have made a friend in me for life. (unless the product or service becomes mediocre)

Anyway, I'd like some input on ICOM HF (shortwave, HAM) products (I haven't given up on Uniden, I intend on purchasing the Uniden 785D when it comes out this fall), and whether or not ICOM maintains a decent customer rapport.

Thanks.

Jim

Haaaaaaaaaa! This is how the engineering staff justifies putting
an ATU network in your ham rigs! So that you can tune out the
SWR hump in your PL-259/SO-239 junction out to the antenna.

I have seen weirdness when tuning infrastructure, where I get
apparently more power out of the other end of the coax or out
of a duplexer, and different readings with different coax jumpers
with PL-259s! Instrumentation is meaningless until you do away
with them.

"Roy Lewallen" <w7el@eznec.com> wrote in message news:3CBF5AA0.808D2AA7@eznec.com...
: Was the insertion loss due to mismatch or to actual dissipative loss? If
: it's mismatch, the "loss" can be eliminated by a matching network.
:
: Here's an example to show the difference. Suppose the connector is right
: at the load, and that the generator is set up to provide 10 volts RMS (2
: W) to a 50 ohm load. The generator voltage is then 20 volts RMS. If the
: connector's impedance at the test frequency is a resistance of 12.2
: ohms, the load will see 50/112.2 * 20 = 8.91 volts RMS, a reduction of 1
: dB from the 10 volts it would have gotten without the connector. If this
: is happening, the connector loss is truly 1 dB, and the loss can't be
: recovered. But on the other hand, suppose that the connector's impedance
: is a pure reactance of 50.9 ohms. The load will see 100/(sqrt(100^2 +
: 50.9^2)) = 8.91 volts RMS just like it did with a resistive connector
: impedance. So the "insertion loss" is 1 dB, just the same as for the
: resistive connector. But this is different. We can make the insertion
: "loss" disappear entirely simply by adding a series reactance of the
: opposite sign at the connector. This cancels out the reactance, and the
: load gets its full 10 volts RMS (2 watts). This second case shows the
: effect of, and cure for, the impedance "bump" caused by a connector that
: doesn't have the correct constant internal impedance. In many cases,
: you'll have a matching network anyway, so you can adjust out the effect
: of the impedance bump with minimal degradation to your system. (The only
: possible degradation is a slight increase in the SWR on the transmission
: line, if the mismatch is at the antenna and the matching is done at the
: transmitter. The increased SWR could lead to increased loss if the line
: is quite lossy to begin with and the SWR increase is appreciable.) A UHF
: connector with Teflon insulation isn't likely to have much resistive
: loss -- measured "insertion loss" is more likely due to impedance
: mismatch.
:

: "Insertion loss" is similar to the concept of "mismatch loss" or
: "reflection loss". I recently wrote about those in the thread "Suggest
: coax for long run" in rec.radio.amateur.antenna, on March 27 and April
: 10. You should be able to find these at http://groups.google.com. There
: was also some discussion recently about misapplying modeling results to
: reach invalid conclusions. If a measurement is made of a connector's
: "insertion loss" and it's taken to imply that it represents real
: dissipative loss, then this could be a good example of that
: misapplication being done.

Well, I'm kind of surprised, since Yaesu, at least until recently, by far
the best to deal with! Icom was pretty arrogant on the phone, and when
they "fixed" the IC-2000 I sent them because it was just horrible with
intermod, it came back deaf as a rock. I called them, and basically,
"That's the way it is, too bad". I sold it, and after a couple of
friends had tried them, an ICOM 2100, and it's a great radio, but Yaesu
was my second choice..my Ft2400 was a great radio, and I never should
have sold it.

Every single time I spoke with Icom, it was the same thing, kind of
nasty, and wanting to get you off the phone as fast as they could. Yaesu
sent me parts I needed, FREE, and helped me with a problem I was having
with my FRG-8800, and later with the Ft-2400(my fault). Kenwood has
always been the worst, as far as I can see, I have dealt with them twice,
once I needed some case parts for a friend's HT I was fixing, and it took
a long time, and a couple of phone calls, to get all of them. Later on,
I had to go through a lot of hassle trying to get a plug I needed that
nobody seemed to carry. Six weeks after they took my order, it showed
up, at an excessive price on top of it.

Another thing that's odd, of all the stores I have dealt with over the
years, AES in Cleveland was the nastiest, most arrogant bunch I have ever
talked to. I was so pissed the last time I tried to order something, I
called the main store to complain about it. And got nowhere. Another
bunch that I wont deal with anymore, unless it's for some small cheap

item, is Michigan Radio. I have friends that have had lots of problems getting defective stuff swapped out.I try to avoid buying from either of them anymore. Universal and Lentini get most of my business, unless they are out of something, then it's the Ham Station, (They have a tendency to pack stuff badly) and R&L.

For reviews go to www.strongsignals.net

RadioShack has the pro-2053 on sale for $180 right now (you can order it online www.radioshack.com if your local store is out). This is the base model of the Pro-93 (which I have and like). It's perfect for police and fire monitoring. Easy to use once you program it, but programming is a little confusing. It also does air and SAME (though the SAME functionality is not obvious to use but it has a one-touch WX button).

Plus it has alpha-tags so you can label what you are listening to with text.

The 278CLT runs for about $150, but is only 100 channels and non-trunking (though it has AM/FM and clock). I'd get the 2053 for $30 more while it is on sale and pop another $10 for a GE clock radio if you really need the time.

If money is no object a lot of people like the 780xlt which runs about $330-$350, but I think it's overkill for police/fire.

I have released the first Alpha version of my software, called ProLink. It still needs a lot of work and testing. If you would like to help test it, you can download it from the website address listed below. Please E-Mail me any comments, criticisms, bug reports or success reports.

The next big feature I need to add is saving and loading of files. I would like to use a standard file format, but since none exists to my knowledge, I am going to be proposing a new standard, based on XML and designed from the beginning to be able to be used by other scanner programs and work with other types of scanners.

You can download ProLink from the website below.

http://albertane.glyff.net/prolink/

I have a grove scanner beam but am looking for something with more gain. The only type of listening I do is 200-400MHz Milair band with some 138MHz milair as well.

What are some of the best antennas that work well in the Milair area? this antenna would be mounted at about 25' on a rotor.

Bill

Eh? Mr. C from BNC? BNC stands for British Naval Connector. :)

Thanks for the response,

I was incredulous when I suggested to one of the managers at Yaesu that poor customer service reflects on the integrity of the product, he replied "I don't think so". Actually, I do think so. It's not so much that Yaesu "may" have had a glitch in returning this radio in a timely manner (due to the moved facilities and "computer problems"), it's more significant that they "NEVER" write or call back when you call "customer service", even after they promised that they would. Why the hell even bothering to have customer service? The exception to my complaint is the Technical Support Department (the actual repair technicians), they would always write back.

Years ago a friend was buying a new Chevy Blazer. My friend had arranged the financing and the dealer said that it would be available in about 2 weeks. But 2 weeks came and went, then 3 then 4, finally the friend called back to express his disappointment at the delay in getting his truck. The dealer replied "you're lucky you're even getting this truck" (implying that they were in short demand and the dealer was magnanimous in even providing one to my friend), my friend promptly went out and cancelled his order. I'm sure that the impact at that time on the dealer was non-existent, but as the word gets around it may have had an impact. I see many car dealers that are now out of business in this area, maybe if the dealers were a little more customer conscious they might still be in business. Bottom line is that I don't need Yaesu, I don't need any amateur equipment. I buy it for hobby purposes. Hell, if I needed to, I'll buy the old boat anchor tube models at a flea market somewhere and they would probably do what I need.

My fondness with AES Cleveland has to do with the speed that I receive the equipment. I ordered my FRG-100 at 5:00 PM Thursday and received it during the day on Friday. Apparently Pittsburgh is in the overnight UPS shipping area from Cleveland, and this is for a standard package, not one sent by overnight delivery. I like the salesman that I deal with, but I have spoken with the manager concerning the FT-840 that I bought. It had the power cord mis-wired that the factory. When I expressed my frustration, he said "look, we don't make them, we just sell them". I thought this was a piss ass attitude. You are supposed to represent what you sell.

All of this has been enough to drive me back slightly from radios and cause me to return to my shooting sports. I just paid $300 for a .22 Ruger handgun, $300 that I had intended to use for a radio. Just think, you can buy a gun made in 1890 and still buy ammunition for it today. None of this crap where you buy a computer or TV game and can't get any software for it 3 years later, because it's obsolete. Look at the advent of digital radio, I have $2000 in shortwave receivers and some schmuck will expect me to throw it all away because they want to use digital transmissions. Same with police scanners

(the digital part), and the odd thing is that they adopt these technologies and tout them as superior, even though we are all aware on many of the shortcomings and failures that these systems have. I have Direct TV, I used to think the picture superior to digital cable, but now that they have been bought by another company and have forced so many signals onto a single satellite (this at least gave me local channels), the picture quality has suffered significantly. Dark scenes frequently have patchwork areas indicating a non-linear transition from one intensity to the other. I have begun to notice motion artifacts, where the foreground characters move jerkily in relation to the background. But we're told that this is a superior application of technology.

Anyway, what dealers have others had great success with? How about manufacturers, any suggestions for models made by companies interested in supporting their products?

Jim

In Michigan the Wayne County Sherriff's name is Fucanno (no bull) and
in "HIS" county (like he owns it) they confiscate your car on arrest
for solicitation and sell it after conviction. He is the biggest car
thief in the country! If a dept doesn't have anything better to do
than bother people for stupid crimes like that, they have too many
cops and are concintrating on the wrong typeof problems.

Daytona Beach is the very same way. The Mayor is this "anti-sex"
mentiality, if he could ban sex the bedroom he would.

On an average day there are 10 - 15 cops working the prostitution stings
while other important calls go unanswered. Yes it happens here and I
hear it. I've seen fights, wifebeatings, and drunk drivers calls be
placed on "hold" due to No Available Units....

In this town the only safe area to be anymore is where the prostitues
and drug dealers hang out as that is the only place that has police
protection. About 4 weeks ago a house down the street was robbed
WHILE THE RESIDENTS WERE HOME! Two doors down had their car broken into
as well. And we live in an "upscale" part of town!

You know, I just realized that the last time I had dealt with Yaesu was
about the time that Standard was swallowed up. Maybe it was the other

way around, Standard (who were pretty worthless, customer service wise)
took over yaesu management and things went sour.

Don't the hams still have a small slice of the 220 Mhz band? You might check with some ham supply houses and see what's there. At one time there were some 144Mhz/220 Mhz combo antennas..
Another possibility is to buy a cut channel TV yagi for channel 13 and trim it to center on 300 Mhz. (you'd have to redo the mount to orient it vertically), but it wouldn't be so hot at 138.
Of course the bigger buck ham stainless steel log perodics cover it all. Last time I looked a smaller one was somewhere around $400.
2 band Yagi's aren't too hard to scratch build on these bands - 8-10 db gain is relatively simple to achive. A simple dipole/reflector design for 138 Mhz will give some gain at 200-300 mhz, but the more directors you put in front, the less response you get on a harmonic.
I found an old Sams book (Television Antennas, by Donald A Nelson, 1951 second edition) that covers broadbanding concepts in early TV antenna designs, including (big) rhombics (12 db gain from channel 3 to 13!) Covering 50-250 Mhz in those days was "rocket science" & they treated it in some detail. If you can dig it up it might offer some ideas.

The solution to the problem of "no available units" is to call in and say that the troublemaker is the one sought for a (drive-by) shooting that had been reported on the news earlier. The cops get bounties for catching such fugitives, and they'll be there in no time at all.

GeorgeF (av8tor@licensed4fun.com) writes:

You're being to harsh on the vice squad whose job is to maintain the monopoly on vice in your city, so that the criminals don't move in and take over, unless you're the black Larry King running a kidy prostitution racket out of your Omaha home to blackmail politicians. Then you can expect to get police protection in exchange for protection money.

Don't you find it strange that the successful criminals usually know who NOT to mess with: politicians, judges, officers, and other successful criminals?

I'm located 30 miles north of Baltimore in Maryland and heard fire dispatch, almost continuous, on 72.580Mhz. It didn't sound local. Equipment is Icom PCR1000 with multiband scanner gorund plane antenna. We did have FM/VHF ducting propagation openings this week due to the weather.

I've heard telemetry and paging on these feqs but never fire dispatch.

Any info appreciate.

TIA.

Andy

Forget the UHF, they are crap. Use the N, it maintains the 50 ohm
impedance through the connector as best as anything. Be as anal as
possible about the installation of the connectors. Wrap them with
monkey shit and tape when done.

C'mon folks, let's get serious, and practical!

Is a Type N connector better than a UHF connector? Yes.

But, what are we connecting this cable/connector to? An antenna, which at best has a 2:1 VSWR over the frequency range of interest. That is, it may look like 25 ohm, or 100 ohm, or any combination of resistance and reactance which results in a 2:1 VSWR. And if the connector adds a VSWR of 1.01:1, or 1.1:1, or whatever, to this, you're never gonna see any effect, positive or negative! Yes, the UHF connector could actually improve the match of the cable to the antenna.

And at the other end, we have a receiver or transceiver with a "50 ohm" impedance. How close to 50 ohm is it? Do you really believe the receiver/transceiver is a better match to 50 ohm, over a broad frequency range, than is a UHF connector? If you do, you're living in a dreamworld!

A much more important consideration should be things like:
water tightness; is the end of the cable well sealed against water intrusion?

mechanical; is the flexing of the cable going to result in loss of electrical or mechanical integrity?

Now, there are places where the effect of the "betterness" of a Type N connector may be seen. In connecting, for example, multiple lengths of cable through 2 connectors and a nipple, it is good practice to use the connector, and nipple, which have the better match to the cable impedance. That may very well be a Type N, or Type C, rather than a UHF connector.

But, when connecting a cable to a totally mismatched antenna, or receiver, let's use a little common sense. You could even use one of those infamous RCA plugs, and not see any observable difference in performance.

Hi all.

I am considering buying an AR8600, and as such, I have two questions for those folks that already own one.

1) What is the VHF/UHF performance like, especially on the airbands?

2) Is it worth the extra money to get the Collins filters fitted?

Thanks in advance everybody.

Troy

Let's get practical, just solder the coax to the antenna, that is the
best connector.

These frequencies are allocated for point to point circuits, such as transmitter control, in this case. There used to be a lot of paging on the 72-76 Mhz band, especially where a paging comapny crossed a border between two phone companies (the line costs skyrocketed for dedicated control circuits). Now between line costs going down and satellite relays, these are not so common. The major downside was the interference that arose when "skip" came in, as they were often used at the practical limits of their useful range under normal conditions. The least bit of noise or interfering signal would render the early digital paging useless. That is probably less of a problem now that the frequencies are not used so heavily as in the 80's, along with what is likely an analog signal and transmitter control system.

2237. ICOM-R3 hatchet job? (blocks more than cell?)

Newsgroup: rec.radio.scanner
Date: 2002-04-21 00:57:26 UTC
From: jabb3rw0cky@netscape.net
Message-ID: <8354e2f6.0204201657.66577b9a@posting.google.com>
Source record: 49154

does the US version of the ICOM-R3 have more than just the AMPS cell phone frequency range blocked?

i was disappointed to discover that some manufacturers (like Yaesu) will block valid frequency ranges up in 900Mhz just to avoid receiving "cell images" on dual-conversion scanners/ht's

what i'm really interested in knowing is whether valid ATV frequencies in the 900Mhz range are somehow blocked "by accident" in the Icom R3.

thanks.

How about RF shielding? N connectors have far better shielding than a UHF connector. Probably not critical on your 2m radio in the car but in our repeater buildings on top of the mountain, you'll find nothing but N connectors on all of our microwave racks and Trunked Radio systems.

I agree with you. people psuh digital soo much. but they forget the range of a digital site is not as far as a analog site. When a digital site is on the fringe of your cell signal, it automatically goes to the analog site. My old town pushes digital 100% but the analog is very popular there too. even though they think they are digital. but it is in a valley. you will not have always digital there.

Back in '87 a number of channels were added to the cell phone band. The GRE-0327A provides the correct 30 kHz search step size for the newer channels.

Sounds like that device would be quite an investment with all that to be
watching...

I would have guessed that the R3 would not have been all that great in that
area of the band, considering that is basically it's upper limit. Thanks
for the confirmation...

Thanks for the info everyone.

I have not heard anymore broadcasts on this frequency since that evening. I'm trying to do a search on Percon's database but have had no luck so far. The dispatches were from a 'Manheim County' but I see no such reference in the database.

I'll keep listening and should I hear some more I'll record some MP3's and post them on my web site.

I'd really like to find out where this originated.

Sorry, the headphones are mono phones. Unless you removed the existing cord and replaced it with a stereo cord, properly wired, I am afraid you can't.

It might be easier to get a set of stereo phones and make up a Y adaptor from an inline jack and a couple of short cords to plug into the two scanners. Alternately, you could make up a small box with the stereo phone jack, a three-position switch to allow listening to one scanner in each ear or either scanner in both ears, and a couple of short cords to plug into the two scanners.

I'd go with the stereo phones and the switch box.

Hope that helps.

It's hamfest time once again and I've found some awesome radio deals out there this year. Already this year have found a nice older Icom PCR-1000 that is 800 mhz software modifiable for $150. Also found a nice working Drake TR-4C with power supply for $75. Just yesterday found a PRO-2006 with the Opto board for $200. Was given for free a little 5" battery operated color TV that needed minor repair.

Hit those hamfests hard!!!!

I never had a problem either but since unblocked scanners are illegal in the USA whenever they ask me whether I'm importing anything I gotta say no. Otherwise, I never had problems bringing equipment both ways.

Hi
I have a Pro 94 scanner. I use my scanner at 16 hrs a day. I need to recharge them once a week using Radio Shack Digital camera charger. Part # 23-033, goes for around $22.99.

Thanks
Good Luck
Vinnie

I am already a member of the Yahoo 8600 group.

I was more after people's experiences with the 8600. There is not that much
of that nature on the group.

>The dispatches were from a 'Manheim County' but I see no such reference in the database.

According to several printed and web sources I checked, there is no "Manheim" County, or county with a similar spelling.

My guess is that you were hearing Lancaster County, Pa., which includes Manheim Township. They have applied for a base station (not a one-way link to a remote) on 72.58 MHz, but the pending license was returned ... which is usually for a technicality that can be remedied easily.

It's not uncommon for agencies to "jump the gun," and put frequencies to use for they don't have the license in hand. It may also be that the county was testing the frequency on the particular day you heard them.

Lancaster County is certainly within your range.

Here's the link to the license on the FCC database:

http://gullfoss2.fcc.gov/cgi-bin/ws.exe/genmen/uls/uls_call_res.hts?db_id=3&callsign=&application_id=1104612

BTW - the next closest FD I could find using 72.58 appears to be Cranston, Rhode Island.

hello,

I know this is a scanner group but your probly the only people that can help with my question. I'm looking for a nice weather radio. Does the SAME technology work? I only want to hear storm/tornado warnings and only for my county. I've heard with some of the radio shack radios it doesn't work well. I would like a portable model thats fairly durable, can be ran off ac and batteries be left inside in case of a power outage. if someone could recomend a good online dealer and radio I would appreciate it.

thanks
Chris

You might do some research on log periodic antennas. They are a broad band beam. There have been articles in various ham radio mags on how to build one. There are companies which also make them. I think you could get one to cover your desired bandwidth.

Well, I own several Radio Shack SAME Alert radios, and have given them as Christmas presents to my parents and brothers, and all have performed just fine. The home units, the 12-250, has a 9 volt battery backup in case of power outage. They also have a handheld model, the 12-254, which I have adapted for mobile operation. There are other radios on the market that may work just as well, but I feel the Radio Shack units are as good as any. Check them out before you decide.

Mark

It certainly does work, but from my experience many of the receivers
out there are so poor that they don't work! I have a Midland, an
Oregon Scientific, and a Realistic, all are SAME equipped. All can
receive weather broadcasts with acceptable clarify and volume.
All use the supplied whip or built in antenna, and all are set to the
same code. I even tried adding an external antenna to the Oregon
Scientific. It didn't help.

Every Wednesday there is a test signal. The Midland ALWAYS goes off.
(and when the weather gets exciting, it also goes off with embarassing
frequency)..

The Realistic goes off about once a month (25% of tests) , and I have
yet to hear a peep out of the Oregon Scientific, and I have had all of
the more than a year. .

>Do you mind explaining how the cell phone ban is "unconstitutional"?

I'm not certain that it is "unconstitutional" --but here's a possible argument:

The radio spectrum is a public forum of sorts. One might liken it to being able to holler across a street at someone else or to speaking in a theater. Does anyone have a right to expect privacy here? I think not.

So why is it that on the spectrum around 880 MHz, the FCC has regulations against monitoring transmissions? That's almost like telling to telling someone not to look out the window!

Now some may argue that yes indeed there are places you're not allowed to look, such as Area 51 (Groom Lake) where secret US military development is done. Thus why shouldn't there be a band that you're not allowed to monitor? The difference is that the monitoring takes place from the privacy of your own home. One can regulate receivers mounted in cars, boats, and/or aircraft. However, regulating what people at home may receive off the airwaves is just plain obnoxiously stupid and probably illegal.

I liken it to having papers blowing across your lawn. You're being told not to collect such papers and definitely not read them. Don't we have a right to pursue knowledge no matter where it comes from?

And let's look at Cell-phone calls: They're unencrypted, but it's not easy to figure out who is calling whom. However, they do have a sociological value. Wouldn't it be nice if we could gather useful data about attitudes, details of ordinary life, and perhaps even a sociological view of what's going on in the cars on the road? I admit, it is a bit big brother-ish. But these days, what isn't?

And let's not forget that these phones are working in the open, unencrypted in any way. The technology has existed for many years to encrypt these phones --but nobody wants to because it's "too expensive." That's like saying it's too expensive to wear clothes

--so let's pretend we are by making a law that says we should all avert our eyes if we should see another naked person.

I'm not sure that this argument is 100 percent fool-proof, but there is reason to think that there are constitutional problems with a prohibition on monitoring unencrypted transmissions.

However, that said, I seriously doubt there is a court in the land that understands the technical background behind this nonsense enough to declare it unconstitutional. The typical person has no idea that a Cell-phone is really a radio. They don't bother to understand the issues because there are too many. It's easier to just let the legislators legislate stupidity they can't enforce than it is to try and educate an entire society on a very obscure issue of privacy.

My friend did the same thing with the Oregon Scientific units and an outdoor antenna made no difference with his radio either; reception did not affect the radio's inability to go off.

>
>
> Every Wednesday there is a test signal. The Midland ALWAYS goes off.
> (and when the weather gets exciting, it also goes off with embarassing

Yes, I recommended to several friends that they should buy the Midland units with SAME, rather than buying the Radio Shack version, which only goes off 25-30% of the the time. The last thing you want is to depend on a weather radio that has issues!

I use a Uniden WX-100, which so far has been fantastic. The radio never misses a test or a warning activation. Sadly, due to poor sales, Uniden discontinued production of this receiver a few months ago.

What attracted me the most to the WX-100, were it's features: external antenna, speaker, relay jacks, amber LCD display, battery backup and the ability to select SAME alerting for all, one, or up to 20 counties. I doubt very much that I would ever have more than three counties programmed into the radio but in the future, the NWS, plans on dividing up larger counties, and allowing users with SAME receivers to set their radios to receive warnings for only their portion of the county they live in.

Source record: 49112
Cross-posted to: rec.radio.scanner,rec.radio.shortwave,alt.radio.scanner

tk500 version 0.4 is now available for free download.

tk500 is an open source programming utility for the
Yaesu VR-500 portable receiver. It supports Narrow
AM mode.

Improvements in version 0.4 include support for both
USA and European version radios, new widgets for
User Port, bank scan, battery save, scan resume, display
and lamp settings, etc. Memory banks may be linked for scanning.

tk500 has a graphical user interface and runs on Linux
and Windows. I'm still looking for MacOS X beta testers
familiar with Tcl/Tk.

You can learn about and download a beta test version of tk500
from my home page:

http://members.core.com/~parnass

I don't warrant the software, though it will cost you nothing.

Thanks to Paul Martin, N8ULS for providing experimental data and
to Dan Wanchic, WA8VZQ for posting detailed
information about the RDF file layout.

I use N type connectors exclusively in my HF work. I also prefer crimp type connectors, vice the solder variety.
While it is possible to get a better solder job than a crimp job, it takes less skill
to do a decent job with a crimp tool. I've seen way too many hack jobs on solder connectors to begin to count 'em. And believe me it's a hell of alot easier to replace a crimp connector when it's still pitch dark at noon, there's a 20 knot wind and the temp is dropping below -40. This makes you glad you shelled out the extra bucks for a crimp tool instead of a propane soldering iron!

As for RG-9913, it is lower loss and cheap, but BEWARE
- It's easier to cause physical damage on this cable
- Water gets into the cable through the connector, penetrates the spiral dielectric
and turns the last meter of the cable into a gelatinous dummy load. A tiny bit of silicone RTV at the end will prevent this headache.
- Of course it needs a different type of connector than RG213

As Rick pointed out, they're mono, and would be hard to modify.

I have a friend who is a spotter. He wears the regular comm headset
the team provides. He also tunes a scanner to race control, and
listens to that through an earpiece stuck in one ear.

You might get two single-ear earpieces, and use one for each scanner.
Get a set of good industrial hearing protectors, and put them on over
everything.

Matt,

I've had a similar experience. I tried 3 different Radio Shack
models and they suffered badly from RF front end overload (I live 3
miles west of Mt. San Bruno just south of SanFrancisco, and there is
about 10 megawatt worth of FM and TV broadcast transmitters plus
paging and evrrything else you can think of up on that hill). The
closest NOAA transmitter is about 30 miles away, so the WB signal is
not real strong around here. Even my PRO-2006 and AOR 1000 have
problems with receiving the NOAA transmitter without intermod.

I finally ended with with the Midland 74-200 that works very well.
It is nearly immune to the intermod, the audio quality is good and it
SAME system seems to work fine. I'd highly recommend this radio to
anyone that needs one.

Regards,
Bill Bowen

Is there any way to block the middle of the night alarms for severe thunderstorms? Every time it rains here we get the alert for severe thunderstorm, and waking me up in the middle of the night, or actually even going off in the daytime is a waste of my time for a thunderstorm.

Well, I don't live in a high RF environment, so that hasn't been an issue for me, but I do live in the fringe area (55-60 miles) for Oklahoma City (actually Norman) NWS broadcasts. I may possibly miss 1 out of 10 weekly tests, due to the mediocre reception in my area. When I had external antennas on my radios, however, there was no problem.

That could well be true, but I have seen many more cables pulled out of
the connector with crimp-type connectors than with solder-type, especially
with BNC. I also think the crimp-type is worse in moist conditions.

(of course you want to protect the connector against moist and cable stress
in all cases)

Hello friends. My employers have tasked me with getting up to speed on governmental use of radio frequencies. Specifically, I'm to come to some kind of determination on the possibility of utilizing the 700 Mhz spectrum for data delivery for a local government. I'm a complete newbie to the field and have a few days to get prepared. I was wondering if anyone could help me out with some of the following:

- Are there any devices currently available to receive 700 Mhz transmissions? My initial research tells me (I think) that any type of scanner COULD pick up such transmissions, but I'm trying to get a list of devices / manufacturers designed for this range. Any online references would be great, I get very little from the search engines with this request.

- Are there any devices available for converting different communication mediums? i.e., 700 Mhz to 800 Mhz or 802.11 to 700 Mhz etc. I'm told they exist, but have been unable to find any concrete information.

- It would appear the the FCC is in the process of beginning an auctioning process for the 700 Mhz spectrum range right now. One thing that I'm unclear on is the geogrpahic zoning of such frequencies. That is, what would determine a Los Angeles bid for a 700 frequency vs. a San Diego request for the same frequency? Are slightly different frequencies assigned, or is there a line of sight / curvature of the earth factor in play wherein both Los Angeles and San Diego could transmit at the same frequency without fear of overlapping signals? Can anyone tell me if the 700 Mhz range will be specifically used for public use, or will private organizations also be able to bid?

- Can anyone provide a primer or links to UHF / VHF data transfer options? Are VHF / UHF frequencies still available?

Thanks so much.
brian

Those are good ideas, thanks guys. I was thinking about just cutting the wire going into the opposite side and wiring in a 2.5 mm female plug. Then, put a male plug on the opposite wire, and make a jumper wire with a male 2.5 and the normal plug going to the scanner. That way, I would still have the volume control I need (running the commentary very low) and Mom can still hear on the other side of the Y connector. Might look a tad weird, though....

BTW, I did use the two-earpiece and industrial mouse ears at first. Worked ok, but was a real hassle if you needed to get up to go to the loo.

2326. where do i start?

Since ATV is wideband video (same as NTSC), you need equipment to see
the video. The PC is not able to handle the signal at real-time since
it's wideband video. One way is to use the Icom R8500's TV-R7100 video
decoder module or look for some down-converters at www.hamtv.com.

Hope this is a qusetion and not a troll.

The frequencies in the US from 144 to 148 mhz are ham frequencies. Also from 440 to 450 are some more ham FM frequencies. Scan the first 5 mhz of the 440 band is for the outputs of the repeaters.

All transmiters or people transmitting must have call signs (excluding certain low power stations) that are assigned by the FCC. Just as a TV station will be WXII or WBTV or soemthing similar the ham calls will be one or two leters, a number , and another combination of leters from 1 to 3 in lenght. Ham calls are usually assigned to the individual person after they pass a test in basic radio rules and electronics. Not hard as many people under 10 have passed the tests.

For info on the ham bands go to www.arrl.com.

OK, I read the directions, got it all taken down EXCEPT, can't figure
out how to remove the display board from the front panel
Found 6 small screws, the directions from Parness say 8 screws (!).
What am I doing wrong?
What am I missing?
Please help!

www.bncantenna.com sells a replacement light, but I haven't tried it. I did buy an 800Mhz antenna from them, though, and it works great on my Pro-93.

Here is the light link

http://www.bncantenna.com/pro-lamp.htm

Well, I don't know what Sears has, but RS has some good ones. If there
is a trunked (computer controlled radios) system near you with
police/fire, etc on it, you probably would want a trunktracker scanner.
A trunktracking scanner will alow you to follow something automatically,
such as a pursuit, by pressing a button.

When the PRO-93 goes on sale again, probably next month, for 169.95, it
would be worth chaecking out. The PRO-92 is another good one. Make SURE
you get a currnet one, both have bugs in the first ones.

There are two base/mobile versions of these same radios, the 93 is the
same as the 2053, and the 92 is a clone of the 2067. At least one of
these radios is on sale now, at least in the US.

Building a scanner would be a huge job, unless you are an electronic
engineer, and even then, it would be cheaper to just go buy one..

Excuse my ineptitude but I am new to this . . .

I have an RS Pro-2036 with a 3.5mm "Line"
jack on the front and an RCA "Aux" jack on
the back. Do I just hook the "Line" on the
scanner to the "Line In" on my sound card,
or is it the "Aux" I should connect to the
"Line In"? Do I have to somehow program
it to send the audio out one of these jacks?
I just want to use my computer's speakers
so I am not worried about recording or
anything complicated. TIA JELo

Hook up the line output. You'll probably need a mono-stereo adapter on one
end or the other. The "Aux" jack is ususally a switch closure to run a tape
recorder with remote control, as in a mic with a switch that starts & stops the
tape. The scanner squelch controls the "aux" switch to save tape & only run the
recorder when there is sound output.

In Chicago I'd get something with the latest trunk tracking built in. If you are not comfortable making extensive modifications for computer control, the 2006 won't be very effective in today's environment. A good trunk tracker will probably have better image and intermod rejection, critical in big city use.
If you want to cultivate a hobby of component level electronic service, making computer interfaces and learning to run bare bones type software, the 2006 is great. If you goal is to hear what's going on around you without too much grief, buy something modern.
You can buy a new Mustang from Ford or a basket case '73 Mach One to restore and eventually end up with a nice car. It just depends on how you want to accomplish the goal.

2348. tk120, need beta tester(s) for new Yaesu VR-120 software

Newsgroup: rec.radio.scanner
Date: 2002-04-24 18:02:17 UTC
From: Bob_Parnass_AJ9S <parnass@megsinet.net>
Message-ID: <3cc6f33c$0$3576$272ea4a1@news.execpc.com>
Source record: 49064
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave

The Yaesu VR-120 is a portable, wide spectrum receiver.

I'm writing tk120, a new open source computer program for
Linux, Windows, and (perhaps) MacOS X which lets you:

(1) Read a memory image from the VR-120 receiver (untested,
need your help).

(2) Read an RT Systems ADMS3 .RDF file (for the VR-500),
extract the memory image, and interpret if for a VR-120.
(Thanks to Dan Wanchic, WA8VZQ for posting detailed
information about the RDF file layout.)

(3) Display data from a memory image using a graphical user
interface.

(4) Extract memory channel information from a memory image
and export it to a .csv (comma-separated values) file.

This is the first experimental version of tk120.
I don't own a VR-120 and have not tried using tk120
to read from the radio.

I need beta testers who own a VR-120 radio and interface cable
to test whether tk120 will read data from the radio and display
it correctly on the graphical user interface.

Be sure to use the Radio menu and try both the USA and
European selections to see if either or both work with
your VR-120.

I've not yet developed the software to write the
changes back out the radio.

You can learn about and download a beta test version of tk120
from my home page:

http://members.core.com/~parnass

I don't warrant the software, though it will cost you nothing.
Thanks!

2349. Why go digital?

Newsgroup: rec.radio.scanner
Date: 2002-04-24 19:40:09 UTC
From: Charlie Durand <charlie_durand@agilent.com>
Message-ID: <1019677302.910017@cswreg.cos.agilent.com>
Source record: 49065

Hi there,

I have been reading about trunked radio systems and how sooner or later they are all going to go digital.

My question is why? Is it for the same reasons that cellphone went digital? To get more out of the same bandwidth?

Can't argue with that. I've never heard a radio using a digital trunked system. Is the quality ok? Is it like the Nextel as far as quality goes? I know my digital cell phone has really good audio quality as long as I've got a good signal but when the signal goes so does the quality. Forget about that whole "it will switch the analog" crap. That only happens when I'm roaming and then the battery lasts half a day because the thing is checking in non-stop at full power.

Anyhow, just curious what the advantages are to go to a digital trunking system.

Thanks!

If you aren't comfortable opening the scanner case and soldering parts inside, you are better off buying a current model scanner designed to follow trunking systems or a current scanner with a built-in computer interface. Trunking systems are computer controlled multi-frequency systems from GE/Erickson or Motorola. They change frequency assignments and let an organization have many small "fleets and subfleets" that don't have to listen to chatter from other whose business doesn't concern them, withoout dedicating a frequency to each small group. The only way to monitor these effectively with a 2006 is to use an external computer (via interfaces you build & install yourself...). New models have the capability built in.
The trunking systems have become prevalent in large cities during the years since the 2006 was produced. There are those who have produced modification schemes and circuit boards that can be added to a 2006 to use an external computer to give it these functions, but they are possibly not something a newbie might want to tackle.
Without modifications, the 2006 is limited to those services that have not updated to a trunking system yet. In big cities this often leaves out a lot of public safety communications and business.

You can't find a much better scanner for areas of heavy traffic.

But the only way to really know how it will work for you is to try it.

Used Icom T8A. Comes with antenna and batt., battery clip is broken. You can get new clips for around $6.00.
The radio does need some work. The PL works intermittently on VHF, and the 6m tx power drops off after you used it for a while. It has the Mars/Cap mod done. The rx is excellent on all bands.
rx- 50-75mhz, 76-107mhz,108-135mhz, 136-170mhz, 300-399mhz, 400-599mhz,600-999mhz (cell blocked)
tx-50-54mhz, 140-160mhz , 430-480mhz
first $150.00 takes it plus $8.00 shipping.

Great, good luck. I just never met a person who made it to adulthood not knowing anything about scannners who knew which end of a soldering iron to grab. Especially a computer board jockey.

Let me put this in a computer metaphore:

The 2006 is the scanner equivalent of a Pentium 286 based computer; It was great in it's day, but this is 2002, not 1992!

Public service communications in the Chicago area is based on 2002 technology, not 1992 technology.

Would you recommend to a computer newby that he buy a 286 based computer? Running DOS? I suspect not.

In other words, buy the scanner equivalent of a 2GHz P4 or Athlon running Windows XP or Linux. That would be a Uniden 780, Radio Shack PRO-93 or 2053.

Leave the 2006 to those who appreciate antiques.

Hey all,
I'm about to buy my first scanner and plan to mount it in my truck. I already have an onboard computer ("brick pc" intel celeron 733 w/ 256mb ram and 1gb of flash storage) with an in-dash LCD display, so I'd like a unit that supports computer interfacing. I'd also like trunk tracking as I live in a large city, and want as wide a reception range as possible (2.5ghz at the high end) but don't absolutely have to be able to scan anything past 1.5ghz. I'm trying to decide between two uniden units, specifically the BC780XLT and the BC895XLT. What is the most versatile and full-featured trunking scanner on the market? Price isn't a huge concern but I want to keep it sane.
Thanks,
Matt Arias

I just checked, and Chicago PD primary ops are still untrunked UHF.

They have some stuff on an 800mhz trunked system;
most detectives, plus housing authority and a few other things.

Not true at ALL. The 2006 was and still is a VERY good scanner for conventional freqs. It has the best front end of any radio in it's price range.

>Public service communications in the Chicago area is based on 2002
>technology, not 1992 technology.

Wrong again, most Chicago PD stuff is UHF conventional, and the 2006 will work FINE there.

If the person buying it likes listening, and can afford it, he can buy a trunktracker in the
future and listen to other services in the area.

Don,
The problems that I have noticed with our Astro crap is the amounts of dead spots, lack of building/ structure penetration,and audio that sounds robotic,scratchy,and processed at uneven levels. Im your neighbor,{ Cleveland.} I am not a fan of 800 Astro at all. VHF or UHF would work much better in urban areas like Cleveland. It must be a real nightmare in areas like Leroy. (Trees,hills ect.) However, I sometimes wish I was the slick one that sold them this crap. 8 sites,25 repeaters per site, and we still don't get the structure penetration that we had with our 250 watt UHF Micor system. We have a VSELP (APCO !16) system, you probably have IMBE (APCO 25)

I grew up in Chicago and started my scanning hobby there. I also have a Pro-2006 which I used when I was there. Here's my take on it.

The signals for the Chicago PD are strong. From the NW side using only the whip I could pick up a lot of the south side. The radio channels are organized with approx. 2 districts per channel (frequency). I also used to use a BCT-70XLT and received everything fine with that as well. I had almost no problems with intermod, etc. with either radio.

If you are going to pay $250 I would just get a trunking scanner. You can get a Pro-93 or Pro-2053 on sale for like $170 or so. If you want to get a bit fancier, you can pop $350 for the 780XLT.

The Pro-2006 is everything people say it is with the great reception, but if you are only going to listen to police/fire in Chicago, it is overkill and you can spend less on one of the RS trunking scanners and get trunking for the 'burbs plus you can program the channels with your PC and they have alphatags (i.e., you can give a name to the channel instead of just staring at a frequency).

Now, if you are going to scan for other interesting stuff like businesses, etc. the Pro-2006 may have the sensitivity, etc. you want. Also, if you want to do advance things like have your computer control the scanner and use software like Probe then the 2006 is the way to go (but it's like $200 for the control board and another $90 for Probe so it will set you back like $550 plus you'll want an outside antenna).

I own a Pro-2006, Pro-2042, Pro-93, BCT-7, and BCT-70XLT. I think all of them are good scanners with different strengths, but for someone just starting I would recommend the Pro-93. Runs on batteries, you can take it anywhere, does trunking, etc. They're not on sale now, but probably next month they will go on sale again.

My first scanner was a handheld (the 70XLT) and I used to take it everywhere with me. The base units tend to have better reception, but again, for police and fire in Chicago it doesn't matter. I also recommend the Scanner Master book for Illinois, and the Chicago pocket guide. They'll give you a good start on frequencies, etc.

Hope that helps!

-Lou

Yes, one of the the biggest advantages cited for digital modulation is for closer channel spacing...generally doubling the available frequencies within a given bandwidth. Trunking & digital are really "apples and oranges," as you can have either without the other... or combine them.

But you do allude to a problem with digital, especially risky in emergency service uses... police, fire, EMS. With digital your signal either goes through loud and "clear," or it doesn't go through at all.

A perceived and/or real "problem" to be understood with digital modulation
has to do with signal threshold. With analog, as a dispatcher I frequently
had to pull an officer's message "out of the mud" (static, weak, picket-fencing, etc) and do my best to piece together what he/she was trying
to tell me. generally enough syllables would come through that an experienced person could make out the message....or at least determine if it
was a call for help.

With digital, however, if a signal is below a set threshold it won't come
thru at all... as in the cellphone example. You get either a nice, fairly
crisp signal or you hear nothing...no middle ground. So it's possible, and
more likely I would guess, that an officer fighting on the ground for his
gun could try to radio for help and the dispatcher and other units would never hear a word.

If you check out the National Telecommunications & Information Administration's site at http://flattop.its.bldrdoc.gov/spectrum/P25/, there
are a BUNCH of test results - along with wav files you can listen to - that
address these and other artifacts of digital and analog signals in various
circumstances.

Interesting stuff. And a bit sobering for those in public safety particularly.

Message-ID: <SJOx8.7762$ab.458724@news2.west.cox.net>
Source record: 49095

School buses frequently operate in the "old" PS - misc public safety sub-band, along with ambulances, search & rescue etc. Not sure why, but been that way for a long time. That's all been lumped together now in the "PW" service for conventional (non-trunked) frequencies. It also depends on whether it's a private company (e.g. Laidlaw, Durham...) providing the service, or the district/county itself. A private company's buses will USUALLY be in a business band; school districts may be in the safety OR business bands.

The old-standby FCC frequency-search site is at
http://gullfoss2.fcc.gov/cgi-bin/ws.exe/genmen/index.hts

It has its own help section, which is pretty good. I can't do a tutorial here, but play with it and see what you can find... just be sure to pay attention to the STATE and COUNTY when you search.

More later... in what county is Wichita??

The Ontario Unlisted Frequency Guide is dedicated to scanner radio hobbists. On here you will find lists of Ontario radio frequencies that are not listed on any web page, published in any scannner book (Haruteq or Scantrix) or listed in the government frequency list (Industry Canada's TAFL). The Ontario Frequency Guide mailing list (oufg) is for scanner radio hobbyists so they have a public forum to be able to chit chat with each other about anything relating to the radio scanner hobby in Ontario as well you will be able to recieve updates of what changes I have made to the Ontario Unlisted Frequency Guide web pages.

Ontario Unlisted Frequency Guide - http://oufg.webhop.net/

Both the 780xlt and the 895xlt are superb scanners Matt. I own both and can't say enough about them. The 780 has several more advanced features over the 895 and thats reflected in its price. Both models can be computer controlled, either way you can't go wrong.

One thing you might want to consider is.....will you ever need your scanner to track digital (Apco 25 standard) systems?? If thats the case, you might want to wait until Uniden unveils their new digital tracker, 785xlt, which is supposed to be released later this year. The rumored prices of around $600.00 sound steep, so if you don't need it, save your money !!!

Chris

Does anyone know if there any way to remove a memory channel from a memory group after you have assigned it? I'm trying to do this with the radio itself, not with software, but will be able to try a software solution as soon as I make up a cable.

tnx es 73 - John, W4AU

Well, I've got you beat, I'm writing this from an AMD 233MHz laptop, my other computer is a 450MHz machine. So, I would not consider myself a "bullshit "purist"". And when I do acquire a new computer, it will be neither "top-of-the-line", nor it will be an antique.

Nor would I purchase a scanner which was not computer programmable. Nor would I purchase a scanner on which it is quite likely I would have to replace the dial backlight, a very hard to get part. Nor would I purchase a scanner that didn't do trunkng. Nor would I pay more for such a scanner than I would have to pay for a new, modern scanner. Especially if I had never owned a scanner and didn't know what it was all about.

But, as Mr. Barnum is alleged to have said, "There is one born every minute."

By the way, somebody on this group is pushing his 2006 for $350. For the extra $100, it must be more "mint" and used even less that the $250 one.

Have fun.

Walt

yes.

>Anyhow, just curious what the advantages are to go to a digital trunking
>system.

Bandwidth and frequency re-use are pretty much the only issue. Going
trunked with digital signals means you can cram more stuff in to
smaller cells and it does so pretty much seamlessly and efficiently
--when it works.

The problem with such technology is that it doesn't degrade gracefully
like analog signals will do.

Oh and don't believe the crap about analog phones sounding bad.
Analog phones used to sound much better than they do today. Compare
an old cell phone from your car to the all digital PCS phones from
today and you'll hear a dramatic difference. The older stuff does
sound better. Admittedly, it consumes more power, it not nearly as
efficient with bandwidth, and it's nowhere near as portable.

The problem isn't analog versus digital. They're both a means to an
end. The problem is bandwidth and the number of customers on the air
at the same time. That's where digital trunking and telephony really
shine.

ProLink is a program for managing and transferring lists of frequencies to
Radio Shack Pro-76, Pro-79, Pro-89, Pro-2016 and Pro-2017 scanners.

The latest version of ProLink has been released. This version add support
for saving and loading files in CSV (comma separated values) format. I also
improved the keyboard navigation in the channel list and fixed some bugs.
You can download the latest version of ProLink from the ProLink website.
The address is below.

I don't believe the crap. My first analog phone was the best sounding phone I've ever owned. Loud and clear.. even with static it still sounded better than my digital signal sometimes.

Size and battery life are important to me though and the pricing on digital just can't be ignored.

I will say my current digital phone sounds much much better than the first digital phone I used to have. That thing just plain sucked.. I always manually siwtched it to analog mode.

This was posted to the VX-5R mailing list, it does work.

To erase unwanted memory channels, do the
following: Push the "F" key for one second till the channel numbers
start to flash. Then with the DIAL, turn to the channel number you
want to erase, then push "MR".

Body handling: Binary attachment payload not displayed: ibtrevor.vcf

What you most likely heard was over the air rekey. On the new DEA and other fed radios they can push a set of buttons and it interrogates for new crypto. This all goes thru the radio system thru the phone/satellite link to a center in Florida. Once the center has verified that this is a valid radio with a valid esn, and the crypto in the radio itself (because with the new motorola there can be multiple levels of security and crypto.) it sends a encoded new day crypto stream back to the radio and it will load it in a memory. Then the radio can be used with all the radios that have been updated in DES Encryption.

Walt;

You obviously have never had a PRO2006.

You are right in that it's not computer controllable without considerable extra expense, and you can get a new Uniden scanner for less, but as far as RF performance is concerned, the 2006 is a wonderful radio.

A new, $1500 Icom R8500 won't trunktrack either, but people do pay for the level of radio performance it provides.

Scanning conventionally in a suburban environment, my Uniden scanners routinely pick up cellphone, aircraft, paging and TV images that make me have to lock those channels out. The PRO2006 sails through all of this without complaint, yet it seems to have equal sensitivity. In addition, there is no annoying squelch tail at the end of every conversation like with several Uniden models.

I don't know about the situation in Chicago, and it might be wise for a neophyte scannist to choose a model with trunking and other cool features, but I think your attack on the 2006 is unwarranted, and to call someone considering the purchase one of the "born every minute," is pretty lame.

You must have had an interesting call phone then. With mine, I either get
everything, or nothing. There is a VERY slim line where I get voice that
cuts in an out, but never a garbled signal. The cutting in an out is in
larger longer chunks, not smaller more rapid cuts, so it essentially makes
whatever is being said unintelligible. But like I said, that point is a
very thin line... Couple feet this way or that way make the difference
between broken, and nothing...

Go to http://www.strongsignals.net for a excellent wealth of information
on scanners.

Your first job is to figure out if your local police an FD are on a regular
system, trunked or digital. If it is digital you are out of luck for now.
There is no law against listening to regular police or fire radios.
Listening in a car may be illegal where you live.
Radio shack has decent sacnners and if by some dumb luck you run into a RS
employee that knows what he or she is talking about they may be able to give
you the info you require on local frequencies and if your area is trunked,
regular or digital.

As far as I can figure:

Fire Ops: 154.430
Fire secondary channels:
154.280
154.295

Park County Sheriff Ops: 151.025

Air Ops: 166.675

Air to air: 125.025 primary
123.100 secondary

Pueblo air dispatch: 168.725
Other Forest Service: 168.600

These freqs. catch most of the action, although there are others in use which are difficult to capture due to weak signals, for example the Hot Shot crews down in the draws etc.

A pretty clean operation so far, with occasional moments of crisis when the fire appeared to be crossing highway 285 and into some subdivisions with lots of domestic animals where owners were off at work. Fortunately the fire hasn't crossed the road yet and all animals have successfully been removed from the threatened areas. Highlights of irate homeowners not being allowed to access their properties, fire-civilian vehicle collision, pseudo fire fighters with flashing blue lights on their vehicle, teenager running wild on dirt bike with no spark arrestor, reports of looting, traffic jams for miles and miles and a report of a second fire starting in one of the neighborhoods which turned out to be diesel fumes from a septic sucking service truck.

So far trunked radio systems would never work for something like this ... ahhh, the good old days. Plus, cell phone service is very spotty in that area, making participants use the radios even more.

Digital systems are much easier to create encryption as well ... a digitized signal cannot be monitored with an analog receiver etc. yadda yadda. Much more private from the outset.

I am sure that convertor works, but the steps on most scanners are going to
be unchangable and you will not get the correct frequencies or you will have
to scan many unused frequencies.

I figured it out, I only found 6 screws and it came apart, and you
don't need to desolder the ground, just remove the knobs and unscrew
the shafts and remove.

Message-ID: <MPG.1732768cc6a7feba989681@news2.tstonramp.com>
Source record: 49029

Anyone know where to get Nascar Winston Cup Freqs in ScanStar format.
I'm going to the race this weekend and need to upload freqs to my AR8000.
I do NOT need a list of freqs. I'm too lazy to enter them manually in my
AR8K. I would prefer .swg format. I have a collection of ScanStar .swg
which includes 1997 Nascar freqs but I need current freqs.
My collection is at http://www.stuver.com/ss_swg.html

Feel free to send me .swg files for sharing.
To respond remove "spam" from address and replace with "rrs".

Cross-posted to: alt.radio.scanner,rec.radio.scanner

Optiscan.zip is a freeware program to assist you in preparing
frequency cards for your vintage SBE Optiscan receiver.

If you downloaded optiscan.zip prior to April 25/2002, there is a bug
that is exhibited when you enter certain listening frequencies.
For example 154.430MHz.

This was due to a rounding error and results in incorrect setting
of the first two windows of the frequency card.

The bug has now been corrected.

You can download the revised program and source code at
http://www3.telus.net/gary-jacek/Optiscan.zip

Many thanks to Dewey Lawing W1DRL for reporting this bug.

Howdy all,

Would like to put a [cheap/small/homemade] scanner antenna up and my condo's no outdoor antenna policy means indoor. No prob. I pick up a lot with a stock metal telescoping antenna as it is. Built a 23.5" out of coax and put it in pvc for picking up aircraft locally. Works great too. Thanks to the guys in this group for the idea.

I'd like to give myself the opportunity to pick up from 25mhz to 1500mhz -- the range of my scanner. Not looking to really focus on anything in particular, but a nice, broad spectrum job would do nicely.

The catch is that I need something that will be cosmetically pleasing to my wife :) I was thinking about taking a 10' length of 1/2" pvc and putting a coax antenna inside, painting it with the same off-white color used on our sheetrock, and sticking it in the corner of the room behind a bookshelf. Most folks probably wouldn't even notice it was there.

So my question... How long of a length do I want it to be? How much coax shield do I strip back? Should I go for a full 10'? Cut it back a little less? Or hit the length that will give me the most gain in the center of the range I want to hear (ie cut for 750mhz -- this midpoint)

Thanks for any advice.

Here's a half way decent scanner antenna i put together recently. I made this up to have a really portable short-wave antenna, and it works very well. I have used it from 6MHz to 850MHz.

Get yourself a set of rabbit ears from an old TV set. Fasten a piece of string to one end of the rabbit ears and use this to attach the rabbit ears to a high point in your condo, the inside wall of a closet, for example. Let the rabbit ears hang vertically. Attach a Twinlead to Type F coax adapter (a balun) to the rabbit ears, and attach a Type F to BNC adapter to the balun. Run a length of BNC coax out the closet door to your scanner. Dress the lead so it runs perpendicular to the antenna for a short distance.

As I said, I have used this to receive from 6MHz to 850 MHz. The fully extended rabbit ears will be a resonant 1/2 wavelength at about 80MHz, and can be shortened to an appropriate length up to about 500MHz, if you want to optimize response at a given frequency in that range. At 850 MHz they can be set to be 3/2 wavelength in length.

Use: 1/2 wavelength in inches = 5600 freq in MHz.

Hi boys & girls:
Does anyone know anything about the AU013 Cellular Telephone scanner?
Advertised as "permits listening in on 800/900 cellular telephone
conversations" where legal I assume (e.g. Canada).
In particular - does this include digital telephones too? Aren't (almost) all
cellulars digital today?
Curious
Thanks BobP

Hi;
Is any familar with the AU-028 X-Interceptor?
Advertising states that it can monitor up to 20 cellular phone numbers - and
then listen in on an in-coming or out-going call to any of these numbers.
However it only analog i.e not digital transmissions.
My question is:
Can it at least track a "digital cell phone" - i.e. know that a cell phone is
"live", digital or analog, is in the cell?
Thanks BobP

I also use the Radio Shack mag mount scanner antenna with my Icom PCR-1000. Works well from the shortwave bands up through 800 MHz. Stick it on a good metal surface, such as a file cabinet or refrigerator, and you're good to go. Also doesn't look too bad indoors, either...

No problem with RF shielding. Phelps Dodge used UHF fittings on their
6 can VHF duplexers for years, and they (Celewave) still continue to do
so. Two UHF
females on each can. That's a total of 16 UHF fittings per duplexer set,
and the product delivers 100 dB isolation. Not my first choice in
connectors, but
it really depends on the skill of the installer for most VHF applications
rather than
design limitations.

Microwave racks and trucked radios operate well above the frequency range
the gentleman who started the thread asked about.

I agree with Walt.

Yes and no!

Regular patrol operations are on 460.xxx with 13 Zone channels (2 Districts to a Zone, with one district on a channel of it's own) and 7 Citywide repeaters, as well as a Citywide simplex channel. Fire operations are on 2 VHF repeaters, 3 or 4 simplex fireground and command channels as well as a couple 460 MHz. EMS channels. It is unlikely that CPD of CFD will be going to a trunked system for patrol or regular operations anytime soon.

CPD does have a Motorola Type 2 trunked system used by detectives and other specialty groups. The city also possesses the old CHA trunked system that will eventually be reconfigured for Streets and San. use.

Cook County has a VHF 5 repeater system along with a bunch of simplex channels. They will be switching to an Astro system sometime this year.

Several suburban areas have Motorola trunked systems and the State Police and 2 suburban counties have EDACS systems.

John, your question would be better asked on the
rec.radio.amateur.equipment newsgroup. I seem to recall that being
possible, but can't recall if I read it in the manual, or saw it on one of
the nice VX-5 WEB sites. You might do some browsing. I no longer have my
VX-5 - traded in on the Kenwood TH-F6... much easier to use menu, among
other things.

the fcc has a list of what frequency ranges are for what service (hams, police, air traffice control, what not). also you could try Police Call, which is a book that radio shack carries (although the kids at the desk won't know what you mean....). it has LOTS of info on what frequencies are used for what....good luck!

Hi gang,

I have several Radio Shack scanners (Pro 2026, 2004) whose nacklights stay on all the time. These scanners function perfectly well for me and I know I will be using them for many years to come. As such, I'd really like to do something about toggling the backlight on/off so I don't burn it out prematurely.

I'm about to go surfing for mods (I know both of these scanners have modifications listed for them but I don't yet know of the light is one of them) but does anyone know if, in general, backlights are easy to bypass by hacking in a switch?

Thanks.

Hello all.

I was considering something tonight as I check post - why not just change the name of this newsgroup to alt.check.cityfreq.com?

The few times I have come here for freqs, it is because I have searched all other possible meens, as I am sure other have. cityfreq.com is a cool site, but if you are looking for a freq that is not currently licensed (which does happen to public safety agencies as I know from experince) there won't be any valid data.

Just some food for thought, please go easy on the raging spam attacks,

Mattster.

From: pop <sumpin@doughnuts.com>
Message-ID: <VEwy8.4$r4.19033@news.uswest.net>
Source record: 48965

Fire Ops: 154.430
Fire secondary channels:
154.280
154.295

Park County Sheriff Ops: 151.025

Air Ops: 166.675

Air to air: 122.920 primary
123.100 secondary

Pueblo air dispatch: 168.725
Other Forest Service: 168.600

These freqs. catch most of the action, although there are others in use which are difficult to capture due to weak signals, for example the Hot Shot crews down in the draws etc.

A pretty clean operation so far, with occasional moments of crisis when the fire appeared to be crossing highway 285 and into some subdivisions with lots of domestic animals where owners were off at work. Fortunately the fire hasn't crossed the road yet and all animals have successfully been removed from the threatened areas. Highlights of irate homeowners not being allowed to access their properties, fire-civilian vehicle collision, pseudo fire fighters with flashing blue lights on their vehicle, teenager running wild on dirt bike with no spark arrestor, reports of looting, traffic jams for miles and miles and a report of a second fire starting in one of the neighborhoods which turned out to be diesel fumes from a septic sucking service truck.

So far trunked radio systems would never work for something like this ... ahhh, the good old days. Plus, cell phone service is very spotty in that area, making participants use the radios even more.

With all due respect Rob,

There is a space agency that I know of where crimp on connectors are mandatory when using BNC. They have been stressed to 2000 pounds pull before failure.

I have seen the type of failures where you can simply pull a connector off. But this is usually due to either wrong components being used for the type of cable, and/or wrong tooling crimping the connector on.

My opinion is that hobbyist will do better with soldering a connector on because of the myriad of cable types he/she is trying attach a BNC connector to. I know I would have to keep quite a collection of connectors and tools to meet even my occasional needs.

Best Regards

Christopher Cox

If these scanners are like my Radio Slack scanners, the backlight is
just wired to the on-off switch. There's no logic circuit involved.

Pretty simple to find one of the wires that power the light bulb and
install a little push button on and off switch somewhere, but that
means hacking a hole into your radio.

Really, I wouldn't worry about burning out the light bulb. Don't
bother with the switch. It's easier and cheaper to just replace the
bulb when it burns out. The bulb costs about 99 cents and is available
at Radio Slack.

Sir Reggi,

Your assessment about changing the lightbulbs may be correct on the 2026, backlight, as I don' know how it's lit. But the 2004 uses an EL panel which is no longer available from RS. There is a close substitute available from Miller Engineering, but changing it is not something everyone can accomplish as you have to unsolder and CAREFULLY remove the old one and CAREFULLY insert the replacement to avoid damage to either the panel or display.

Mike

SB

You'll love your 2006. Take a look at this site. John designed a simple circuit with companion software which allows you to load the 2004/5/6 from your computer. It also allows you to manage frequencies in a database for upload. I built the parallel version and it works very well. Total cost was under $25.00 as I had a lot of the run of the mill components already.

http://www.qsl.net/ka2pyj/index.html

The only difficult part of the whole operation was getting to the back of the keyboard header.

Happy scanning.

Mike

Here is the probable solution. This excerpt was taken from::
http://www.repairfaq.org/REPAIR/F_BC_Repair.html

Uniden/Bearcat BC200XLT Portable - Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no
audio and the green backlight no longer functions, a tiny transistor
may have failed.

Check for a defective PNP surface mount transistor, Q201
(2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several
stages of the BC200XLT. Its main purpose is to switch off power hungry
stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen
below a threshold. That's an attempt to limit the current drain on
weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the
black multi-pin connector which mates the Micom and main boards
together.

Q201 can be destroyed by a few different causes, primarily, by
something in the scanner drawing too much current through it. In one
case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located
on the component side of the main board, connected from pin 8 of the
audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another
BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it
worked fine. In a pinch you bypass Q201 by soldering a short piece of
bare wire between the collector and emitter, but you must first fix
the component which caused Q201 to fail.

I have a nib 2006 forsale for $350. I am in Southern California if anyone would like to see the scanner in person. Yes, it is really new in the box! The 2006 is the best scanner made and has the best RF performance and image rejection. This is extremely important if you live in a big city or near paging or cell transmitters.

For the record....

If you took the time to look at ALL the pictures in your haste to bust my balls, you will plainly see the case and AA battery holder.

I neglected to list it in my text, and was going to make an addednum this morning, but low and behold, some SMART radio hobbyist bought a brand new in box, never used Euro version Alinco DJ X2000. My feedback speaks for itself.

Your size 12 foot matches your size 12 brain.

Well, I actually did not make a "buck" but took a loss.

It is unfortunate that you have to explain yourself as a result of a jerkoff like Mark.

The radio sells currently for $580.00 new at Javiation depending on the exchange rate.
Add the cost of the case, AA battery holder and Euro to US as adaptor, and if you do the math, there was NO buck to be made.

also note that toggling off the el is not a good idea--you will not be able
to see the display unless you have a strong light directed at it.

EDACS & LTR systems require that you put the frequencies in a certain
order. Motorola can be in any order or channel arrangement.

Javiation's website...

Prices & Availability

The DJ-X2000E is now available from stock.

Within the UK/EU the price is ï¿½429.00 including VAT

For export outside the UK/EU the price is ï¿½395.00 Pounds. This excludes Tax (not payable) and
includes delivery by UPS. As a guideline works out to be about US$570 with exchange rates as they
are at the moment.

> don't get fixed, I'll just have to keep checking.

You'll want to go to www.yahoogroups.com and check out the Pro-93 group. There are different firmware revisions each with its own bugs. I have a rev. 1.0 that has some tagging bugs, but they don't bother me (they annoy some people). The current rev is 3.0, and that has a strange bug with the contrast control.

These bugs are no big deal, but you may as well make sure you are getting the current version of the firmware. Otherwise, you have to send it in to get it upgraded.

DO NOT buy the programming cable from them. The one they will try to sell you doesn't work with the Pro-93. You can make your own or get this one (this is the one I use): http://www.pro93.com get the two-way so you can read and write from it. The software is free.

The scanner runs off 4 AA's, so I also recommend picking up 4 AA NiMh batteries and an AC adapter. The scanner will charge them for you if you don't have a charger but have the adapter plugged in (scanner takes 15hrs to trickle-charge them instead of 1 hour in a fast charger). I plug mine in at night and in the morning it is charged enough for me to go.

Sounds like you are having fun with the Pro-2006! Welcome to the world of scanning!

-Lou

This is why I like paper/ book format frequency directories, the data may seem to be "stale" after several years but the frequencies that have expired licenses my be listed in them. So keep that old book around and check back for unknown users, after you have exhausted the on line frequency databases search. I find expired license to be more of a business band/allocation problem.

2504. Create Log Periodic Ant .vs. KMA's Log.

Newsgroup: rec.radio.scanner

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I think I've narrowed down my new antenna choices to either the Create Log-Periodic (5130-2N) which I've found on the net at 269.95+s/h or the KMA Rover which sells for 255.00+s/h.

Anyone in the group have any experience with either of these?

A question I have regarding the advertised dBi gain. Create claims to have 11 dBi gain. KMA doesn't advertise the gain for the Rover however all their other VHF/UHF Logs are advertised at about 7 dBi. Why would there be a 4 dBi difference between the two?

burn it out prematurely.

Certainly the 2004 can be done - mine is ! (And my 2005 & 2006) You will
need though to cut one of the PCB tracks behind the switch which gives you
on/off instead of on/dim. I can't remember which track though so do a
search for '2004 light mods'. The readout is perfectly legible without the
backlight.

Amateur Radio Newsline™ Report 1289 - April 26 2002

Amateur Radio Newsline report number 1289 with a release date of
Friday, April 26th, 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. Amateur radio aids in the aftermath of two rail accidents. This story is first on Amateur Radio Newsline report number 1289 coming your way right now.

(Billboard Cart Here)

**

RESCUE RADIO: HAM RADIO ASSISTS AT CALIFORNIA TRAIN COLLISION SITE

Amateur radio played a pivotal role following two major rail accidents occurring within a few days of one another. On Tuesday April 23rd, a Southern California Metrolink commuter train headed to San Juan Capistrano collided with a mile long freight train that may have missed a stop signal and wandered onto the same track. 2 people on the commuter train were injured and over 260 injured. Local hospitals were swamped with casualties. Joe Moell, K0OV, has more:

--
About four times a year, the hospitals and emergency responders in Orange County, California, hold large-scale drills to test the patient triage and transportation procedures that must be followed in the event of a mass casualty incident. The Hospital Disaster Support Communication System -- an ARES group with agreements to support all 35 hospitals in the county -- is always asked to participate. So it was on Tuesday, April 23 as two dozen HDSCS members awaited their assignments for a mock hazardous material incident, to be staged on a shopping street in Brea, California at 9 AM.

But it was not to be. At 8:10 AM, just 5-1/2 miles away in the city of Placentia, a 6000-ton mile-long freight train collided with a Metrolink double-decker commuter train. HDSCS hams were immediately assigned to the fourteen hospitals expected to receive patients. For the next 4-1/2 hours, a total of 28 hams provided vital links between these hospitals, the county's Central Point ambulance dispatch, and the county's Emergency Medical Service agency.

--
[sound bite 1]
--
Other traffic included verifying victim dispatch, locating victims, providing hospitals with information for inquiring victim families, and liaison with hams supporting the Red Cross. Within some hospitals, hams provided direct

communications between triage areas, Emergency Departments, and Command Posts. Dennis Kidder WA6NIA tells how important this was at one facility:

--
[sound bite 2]
--
This was the 75th actual hospital communications emergency in the 21-year history of HDSCS. From Orange County California, this is Joe Moell K-zero-Oscar-Victor for Amateur Radio Newsline.

--

More on this in a future Amateur Radio Newsline report. (ARNewsline™)

(Note: For more information about this organization and about effective ham radio support for hospitals, go to www.hdscs.org.)

**

RESCUE RADIO: HAM RADIO ASSISTS AT FLORIDA DERAILMENT

Ham radio also helped provided coordination of emergency services following a train wreck near Crescent City Florida on Thursday April 18th. The accident happened at about 5:15 P-M Eastern time. Billy Williams, N4UF reports from Jacksonville:

--

The accident killed four passengers and injured 159 other passengers. It happened after the engineer of an ill-fated Amtrak train saw damaged track and hit the emergency brakes.

Rescue workers say 21 of the train's 40 cars including 14 of the 16 passenger cars derailed. Seven flipped on their sides, lying along the mangled track in a zig-zag pattern. Some passengers escaped through windows, while dozens of were trapped inside for hours.

Soon after the accident Bill Krueger, KF4EJD, was on the scene and at the wreck site relaying information to hams associated with ARES. Other hams soon had portable stations operational at the Putnam County Emergency Operations Center and the Crescent City High School shelter. A secondary shelter at Middleton-Burney Elementary School was established to assist in moving the passengers.

At the peak of activity, about 400 people were sheltered at Crescent City High School where a triage center had been set up. Also, a group from the Northeast Florida Chapter American Red Cross headquartered in Jacksonville was sent to the scene. This included several Jacksonville ham radio operators and a Red Cross Emergency Response vehicle.

Two hospitals in Jacksonville were staffed by Duval ARES operators to provide status reports to medical volunteers who were ready to head to the site if needed. Their help was not required and the hospital ham stations were secured at 10 PM Eastern time..

Meantime., the Florida Crown Emergency Net was in operation on the W4IZ Repeater System which was linked to the KF4PXZ system in Palatka. The net was in session from 5:30 to after 11PM.

There were many hams who volunteered in this emergency. Far to many to list here. And they once again proved that ham radio was willing and able to help when called on.

For the Amateur Radio Newsline, I'm Billy Williams, N4UF, in Jacksonville Florida.

--

According to news reports, many of the train's 418 passengers were senior citizens traveling between northern homes and winter retreats. (N4UF, ARNewsline™)

**

REALLOCATION: FCC PUTS ARRL NOVICE BAND PROPOSAL TO PUBLIC COMMENT

Comments are due to the FCC by May 16 on An ARRL petition that would eliminate the 80, 40 and 15-meter Novice and Technician Plus CW subbands. The information is from an ARRL Bulletin. Amateur Radio Newsline's Paul Courson WA3VJB, reports from the nations capital:

--
Designated RM-10413, the notice is aimed at reusing the current Novice spectrum in part to expand the 80 and 40 meter phone subbands. The ARRL's petition was filed in March asks the FCC to eliminate the Novice and Technician Plus Morse only subbands and divvy them up alleviate what the ARRL sees as overcrowding elsewhere.

If the FCC goes along, the current Novice and Technician Plus would be permitted to operate on the 80, 40, 15 and 10-meter General-class CW allocations at up to 200 Watts output. For General and higher class operators, the ARRL plan would implement changes in the 80, 40 and 15-meter phone bands, expanding phone segments for many amateurs.

But the ARRL petition goes well beyond just refarming the Novice bands. The League also seeks FCC permission to use spread spectrum on 222 to 225 MHz. It also proposes to expand the pool of special event call signs beyond the 1 by 1 format to include identifiers for United States territories that do not provide for mailing addresses. The ARRL also wants to incorporate into the rules a 1990 FCC waiver authorizing amateurs in specific areas of Colorado and Wyoming to operate on certain segments of the 33-cm band. Lastly, the petition asks that the government clarify rules to indicate that modulated CW is permitted for repeater station identification.

May 16th is the designated commentary cutoff date on RM-10413, and the FCC is expecting a lot of response on this one.

Paul Courson, WA3VJB, Washington.

--

And we at Amateur Radio Newsline want to know your position on the reallocation of the current Novice subbands? Do you like the ARRL proposal? Do you have what you consider a better one? Should the subbands even be re-farmed? We would like to hear from you. Please send us a short e-mail with your opinion and we will put some of them on the air in future newscasts. The electronic address is news;ine@arnewsline.org. (ARRL, ARNewsline™)

RADIO RULES: HAM PETITIONS FOR MANDATORY FIELD REPAIRABLE RIGS

How would you like to be able to take the cover off your radio and replace a plug-in highly complex integrated circuit, put the cover back on and have the radio work again. Kind of the way it was when tubes rather than solid state ruled ham radio. Well, that is what Nickolaus Leggett, N3NL, says hams should be able to do and he is asking the FCC to provide the rules to make it so. Amateur Radio Newsline’s Bruce Tennant, K6PZW, has the details:

--
Nikolaus Leggett filed his request to the FCC in February. After reviewing it, the Commission has assigned it as RM-10412 and has set May 16th as a commentary cutoff date.

What Leggett suggests is not really new. He believes that Amateur Radio operators should have a fighting chance to keep their own gear operational. He acknowledges that today’s high tech equipment may not be component level serviceable, but he as asking the FCC to make mandatory certain key aspects of design so that a ham with a general knowledge of troubleshooting techniques might get a broken radio back in operation. Especially in time of a declared emergency.

--
Leggett: “What I proposed is that the Commission establish some sort of standards that would essentially establish that equipment be field repairable in some manner. Either it should have replaceable modules or replaceable circuit boards or parts on a circuit board should be spaced at a certain distance so that you can access them. There should be LED indicators on digital busses. There should be test points to take voltage and current measurements. In other words the equipment should be accessible for the Amateur to repair or modify it.”
--

Leggett acknowledges that should the FCC adopt his recommendations it will probably lead some makers of ham gear to drop out of the United States Amateur Radio marketplace:

--
Legget: “My response on that is to look at the QRP field. There is a very nice Single Sideband QRP transceiver kit, which costs about $700. It is fully field repairable. It is advertised allot in QST Magazine, and this indicates that there certainly are vendors in the marketplace who can come out with a nice piece of equipment; highly regarded; very well reviewed; and at a reasonable price that is field repairable.”
--

For the Amateur Radio Newsline, I’m Bruce Tennant, K6PZW in Los Angeles.

--

You can hear lots more with Nickolaus Leggett on this weeks RAIN report. Take your web browser to www.rainreport.com or call area code 847-827-7246. Meantime, the manufacturers who supply ham gear are expected to file in opposition to the Leggett rule making request. (ARNewsline™, RAIN)

**

SPECTRUM USE: FCC ON AMTS AND DENIALS TO HAMS

The FCC has approved proposed rules allowing geographic based licensing of coast stations in the Automated Maritime Telecommunications Service, the primary user of the 219-220 MHz band. According to the ARRL Letter, the Commission also agreed to consider an ARRL petition for changes in the rules governing the secondary amateur allocation at 219-220 MHz.

Amateur use of the band within 80 kilometers of an the Automated Maritime Telecommunications Service or AMTS coast station is currently requires permission from the AMTS licensee. Industry practice has been to routinely deny such requests, regardless of channel separation.

Now, the FCC will consider whether AMTS licensees denying permission should be required to give a technical justification for the denial. This, in conjunction with the ongoing 3-G proceeding that's considering use of 216-220 MHz for new technologies. (ARRL)

**

SPECTRUM REALLOCATION: CONGRESS PROPOSES DELAY IN UHF CHANNEL AUCTION

Congressional lawmakers say that they plan to introduce legislation to delay indefinitely the Federal Communications Commission's June sale spectrum currently used by television broadcasters to wireless carriers. Amateur Radio Newsline’s Norm Seeley, KI7UP, Takes a closer look at what is about to transpire:

--
The proposed legislation is being sponsored by House Energy and Commerce Chairman Billy Tauzin and ranking Democrat Representative John Dingell. The current law requires the FCC to auction the spectrum used channels television channels 52 through 59 by September 30th of this year. But if Congress says O-K, the measure will eliminate the legal deadline in September for an auction be conducted. It will also tell the agency not to go forward with the sale

slated for June 19th.

The anticipated congressional action is intended to give more breathing room for broadcasters to move off their current analog television channels. It would also give mobile telephone carriers more certainty about a date when they would obtain this spectrum so that they make available a number of new services.

So far, no one has gone to court to force the FCC to hold the sale.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP.

--

More on this story in future amateur Radio Newsline reports. (Published news reports)

**

RADIO RULES: COURT SAYS OWNERSHIP CAPS ARBITRARY AND CAPRICIOUS

Another blow to those who support a cap on the number of media outlets any one company can own. This, as a federal appeals court rules in favor of easing an FCC regulation that bars a broadcaster from owning two TV stations -- known as a duoploly -- in a single market. That is, unless there are eight other broadcast TV stations in that same market.

The court held that the Federal Communications Commission was arbitrary and capricious in excluding cable companies and other media outlets from the eight outlet standard. The ruling also admonished the FCC for failing to back up its argument that diversity and localism are protected by broadcast stations alone.

The court stopped short of declaring the duopoly rule unconstitutional and throwing it out altogether. Rather it directed the FCC to rethink that part of the rule dictating what constitutes a broadcast voice in any given market. (Published news reports)

**

RADIO LAW FOLLOW-UP: TOWERS VS. BIRDS

The United States Fish and Wildlife Service believes that communications towers are estimated to kill 4 to 5 million birds each year. And the service says that these kills violate the spirit and the intent of the Migratory Bird Treaty Act.

Now, a new organization called the National Antenna Consortium has been formed. Its purpose is to help communications companies deal with bird kills and other vexing issues associated with tower construction.

The CGC Communicator reports the group held a meeting at the recent National Association of Broadcasters meeting in Las Vegas. Speakers included Andrew Skotdal of KRKO Radio and attorneys Barry Umansky and Fred Hopengarten, K1VR. More information is on the web at migratorybirds.fws.gov (CGC Communicator)

**

NAMES IN THE NEWS: KB0G SPEARHEADING LINUX

A alternative computer operating system now has a ham helping to develop it. Nate Dueher, WY0X, reports:

--
One of the worlds largest Linux organizations now has a ham radio operator as its leader. Bdale Garbee, KB0G, of Blackforrest Colorado, has been elected as the 2002 Project Leader for Debian Linux. Bdale, who is known by many hams for his excellent work on many Amateur Radio projects including the RUDAK system on board AO-40 has also been on the software development team for Debian Linux for many years.

Debian -- spelled D-E-B-I-A-N -- has excellent support for many popular ham radio modes including CW, RTTY, packet radio, APRS, PSK-31 and many others. It is a version of the Linux operating system known world wide as dedicated to free software, quality and even ham radio. Bdale’s leadership skills should prove to be a match made in technology.

For the Amateur Radio Newsline, I’m Nate Nueher, NY0X, in Colorado.
--

More information on Debian Linux can be found in cyberspace at www.debian.org. (NY0X, ARNewsline™)

THE THANK YOU CORNER WITH ANY JAREMA, N6TCQ

Last week, Support Fund Administrator Andy Jarema, N6TCQ, presented the latest Newsline fiscal report. Andy is back with us this week to say thanks to those who supported Amateur Radio Newsline™ in the month of January. Here is N6TCQ:

--

In the month of January we heard from Benton Bonney, W4PE of Orlando Jodie Steggerda, N8ALJ of Champaign, IL. From California, we heard from GEARS, the Golden Empire Amateur Radio Society of Chico, as well as associate Joann Biegler, William Walters, WA2IBM of San Jose CARA, the Catalina Amateur Repeater Association Bruce Murray of Seal Beach and Jim Truran, KE6FNJ of Encino.

Thanks to everybody for their support. A reminder that Newsline is a 501c 3 and a California non-profit corporation; all contributions are tax-deductible. The address for the Newsline Support fund is PO Box 660937, Arcadia, CA

91066. I'm Andy Jarema, N6TCQ.

--

Thanks Andy. (N6TCQ)

**

RADIO BUSINESS: AEROFLEX BUYS IFR

If you use R-F test equipment to keep your repeater operating, listen up. According to Chris Boone, WB5ITT, Wichita Kansas based Aeroflex Inc. is acquiring IFR Systems Inc. – maker of the famed IFR Spectrum Analyzer and other R-F test gear. According to an April 15th press release, Aeroflex is paying approximately $60 million in cash for IFR. (WB5ITT)

**

HAMVENTION 2002: ARRL DIGITAL VOICE FORUM

The ARRL Digital Voice Working Group will host a Digital Voice Forum at the 2002 Dayton Hamvention. The session will include presentations from experts in the fields of digital-audio hardware, software and other technical details. Applications from rag-chewing to emergency communications to digital audio broadcasting will be covered. The date is Sunday, May 19th at 10:15 at the Hara Arena Meeting Room 1 immediately following the ARRL Forum. (ARRL)

**

INTERNATIONAL – UK: SPECIAL EVENT STATION GB2PK

On the international scene, word that United Kingdom special event station GB2PK will be on the air intermittently from the 26th of April for a month from the Porthcurno Telegraph Museum in Cornwall. The operation will use both vintage 1950’s military and modern ham radio gear. QSL as directed on the air. (GB2RS)

**

INTERNATIONAL – SOUTH KOREA: SPECIAL EVENT STATION HL17FCW

Also involved in a celebration HL17FWC. This station is on the air from South Korea to commemorate the 17th FIFA Football World Cup. QSL via HLZ0HQ. (GB2RS)

**

CONTESTS - WRTC 2002: UNITED ARAB EMIRATES TEAM INVITED TO 2002 EVENT

From the world of contesting, word that the WRTC 2002 Organizing Committee has decided to invite the A61AJ team from the United Arab Emirates to be the representative of the contesting community in the Middle East. According to a WRTC press release, the teams operating from A61AJ have achieved superb results over the past few years. WRTC planners say that this invitation seeks to recognize this fact. Team UAE will be led by Ali Al-Futtaim, A61AJ. Al-Futtaim is well known as the driving force behind the development of what is one of

the premier contest superstations in the Middle East and Asia. (WRTC)

**

DX

In D-X, Cuban VHF DX'er Arnie Coro, CO2KK says over the VHF Reflector that six meters is, properly named the magic band. According to Coro, while testing a balcony mounted half wave dipole he heard VK2ZF calling CQ on CW several times near 50.106 MHz. Coro says that the signal was good copy with no signs of echoes. Arnie responded but with only two watts and a dipole, no Q-S-O was made. Coro says that if he had been running at last 5 watts and a beam, that contact would have been made. (VHF Reflector)

**

THAT FINAL ITEM: AN EDITORIAL - WHERE HAVE ALL THE NOMINATIONS GONE?

And finally this week, an editorial word about the Amateur Radio Newsline Young Ham of the Year Award. Here is our producer Bill Pasternak, WA6ITF:

--
Im going to start this commentary with one word: Help!

Why help? Well its now the end of April. The nominating period for the 2002 Amateur Radio Newsline Young Ham of the Year Award has been open since February 1st. We have announced it at the end of every newscast for almost three months. Sadly, to date, we have not received what we consider to be a single viable nomination. Not one!

Normally by now we have received at least a dozen or more nominations. As this is written, all we have are the usual letters asking that we enter a youngster in a contest that some think the award to be. To paraphrase one: "Our 5 year old just got her ham license so send a free radio."

But that is it! And for the record; the Young Ham of the Year Award is not a contest. Rather its a way to honor the accomplishments of youth in ham radio. It has been that -- and only that -- since 1986.

The nominating period for this years award closes on May 30th. Just about 4 weeks from now. As it stands, there may be no Young Ham of the Year Award presented in 2002 unless we begin to receive valid nominations. And that is where you come in.

Do you know of a young ham -- age 18 or younger? One who has accomplished something really special using Amateur Radio? Well, what are you waiting for? Now is the time to nominate that person.

Does your radio club have a youngster who has been an outstanding member. Maybe one who does far more for the club that most of the grown-up hams? Again, what are you waiting for? This very moment is the time nominate that boy or girl.

How about that quiet young ham who is always willing to volunteer in public service events? You know; the one who does everything from organizing the

communications to keeping the club repeater operating. Ill say it once again: What are you waiting for? Nominate that person.

I think you get the idea.

OK. How do you file a nomination? Simple. You go to www.arnewsline.org, scroll down to Young Ham of the Year Award. Click on the rules. Read them. Click on the nominating form. Download it. Fill it out and mail it in or e-mail it to us. Its that easy.

We at the Amateur Radio Newsline™ believe that the future of our hobby, our service and our nation is in the hands of the young. It will be the next generation of young hams who will be the technologists, public service leaders and political leaders of this new millennium. The Young Ham of the Year Award is one way to guarantee that there will be this “next generation” of ham radio leaders. By taking the time to nominate a youngster for this award, you take one step to help insure the future of Amateur Radio.

Thank you. Roy.

--

If the award is made this year, the youngster selected will receive a trip to the Huntsville Hamfest and a ham radio gift courtesy of Vertex Standard. He or she will also be treated to a week at Spacecamp Huntsville thanks to the folks at C-Q magazine. (ARNewsline™)

**

NEWSCAST CLOSE

With thanks to Alan Labs, AMSAT, the ARRL, the CGC Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, the RSGB and Australia's Q-News, that's all from the Amateur Radio Newsline™ Our e-mail address is newsline @arnewsline.org. i DID find this description of the frequency range at
http://www.aesham.com

Frequency Range: USA version: 0.495-815.995MHz, 902-2450.095MHz;
Non-USA version: 0.495-2450.095MHz

funny enough, bandercom nor aesham have replied to my emails about
export sales.

oh well...

one of these babies coupled with a "nanobug" from
http://www.supercircuits.com would be pretty useful for covert
surveillance...

2521. Yee Haw! Princeton to Increase Redneck Quotient

Newsgroup: rec.radio.scanner
Date: 2002-04-29 01:06:46 UTC
From: Norm <CatchMe@Cheers.com>
Message-ID: <G01z8.39193$Il1.1989@news02.bloor.is.net.cable.rogers.com>
Source record: 48936

Anyone who claims that Princeton is a diverse community has about as much common sense as a goat's left nut sack. After years of avoiding the feared diversity question, the administration has at last formulated a plan to increase the representation of one conspicuously absent group, a group that has been left behind by what the elites call "culture," or "good grooming." You'll know them from those toothless grins that can only be the product of years of inbreeding: the hicks with a penchant for moonshine, NASCAR, and the NRA. They are the white trash, and their time at Princeton has come. While the Trustees are pushing an increase in the Redneck Quotient, Deans Hargadon and Montero cite many possible problems. Not withstanding the unusually low SAT scores among the group and the generally unsanitary living conditions that trailer trash prefer, further difficulties might include convincing the group to come to Princeton, an upper middle class town with a dearth of such standard white trash attractions as auto racing tracks, bowling alleys, and cheap hookers / loose cousins. "So we might not have the amenities these people desire, so we might not be able to attract the cream of the redneck crop," Hargadon said. "We will get some rednecks. They might not be the best rednecks, but gosh darn it, they're better then the rednecks we have now. Dumb rednecks beat no rednecks any day."

One plan to increase Princeton's redneck attractiveness is to construct a Center - much like the current CJL - for Redneck Life; or, to be politically correct, a Center for the Culturally, Mentally, Economically, Sanitarily, and Chromosomally Impaired. The center plans to offer tutors in basic English to teach the new students such valuable life skills as how to formulate sentences with both nouns and verbs, and the key difference between the plural "Y'all," and the singular "Y'all."

I hope you guys can help me. I'm in need of a baby monitor that CANNOT be listened to by someone with a scanning receiver. Is there such a thing? I need the foolowing features . . .

1. I need some type of room monitor that has secure communications, spread spectrum maybe.

2. What I'm looking to do is set the transmitter in my radio room and be able to take the receiver to any part of the house and listen to the audio in the radio room.

I figured if anyone would know it would be you guys. Any suggestions would be GREATLY appreciated.

Ramsey Electronics makes a simple scramble/descramble kit. It's frequency inversion, but the average idiot can't hack it. By the way, if you hear a conversation that's freq inverted and you have a ssb radio with a VFO that can lock to the conversation you can tune a little above or below the freq with USB or LSB and decode the conversation.

Yes, there would be cellular phone images
in that range because. The DJ-X2000T
employs a first IF of 304.3 MHz in the 1400 MHz area.

Sounds like Norm is excited. He finally gets to move his wife/cousin
out of the trailer park and make a new start with the uppity folk. Of
course - he'll be the one teaching the difference between singular
"Y'all" and plural "Y'all."
The down side is his children won't be able to marry their cousins,
but they can still marry each other.

(Rumor has it that Norm's wife/cousin is really his sister anyway. If
that's true, then his children will be able to marry their cousins.)

I do not see the point in having a baby monitor that uses secure
communications.
Except if the Bush has a new kid...
But anyways, I have never seen such a beast. Can anyone confirm?

I haven't seen anything like that. Fisher-Price has their label on a
baby monitor with speech inversion "scrambling" to prevent casual
monitoring by others. For the unwashed idiots who can barely punch
the right numbers on their scanners, this is sufficient. However,
most folks reading this news group know how to defeat such measures.

sure, you can unscrew the knobs instead of unsoldering the ground wire, but did you have a thin walled deep socket to unscrew it with? or did you grind away at it with pliers like everyone else? I have bought a lot of used scanners and most look like the only tool the previous owner had was a beaver!

Let's have an understanding right now Rob. You have lumped "ALL" Americans into one group, that just isn't fare. Not all of us think or believe the same. In fact, we are no different than Canadians.

Heck, I don't own the world, just the tiny piece I live on.

Regardless of what country you reside in, if there are laws for or against telephone monitoring, if a person wants to go against those laws they are going to do so.

I have the tabletop RadioShack unit (the older one) and it has worked
flawlessly for me for years.

The SAME technology works great. On my unit, you can set it for up to 16
counties, or just have it sound on one county.

The newer RS units can even allow you to specify WHICH type of alert you
want it to sound an alarm on.

2561. New Orleans Jazzfest Freqs/Talkgroups

Newsgroup: rec.radio.scanner
Date: 2002-04-30 15:53:22 UTC

Cross-posted to: rec.radio.scanner,alt.radio.scanner

So does anyone have freqs or talkgroups used at last week's (or last year's) New Orleans JazzFest? The second half is this weekend (May 2-5) so it would still be very useful.

I attended several years ago, and they still used the UHF itinerants (464.500,...) Do they still use these?

PLs and DPLs would also be useful, as the intemod can be bad.

Also, is the NOPD UHF (460.025) link for the French Quarter still active?

Why!! oh Why do people keep going on and on about the pro 2006. OK, so it was good in its day, but now, compared with even a tiny R2 or VR500, the 2006 is crap. for goodness sake let the old junk go and lets get on with new technology. I have seen these 2006's going for $300/$400 dollars on ebay, these people must be barking mad, I bought one for ?50.00 UK pounds (approx $73.00 US) about a year ago and I thought that was to much. I find it very limited, slow and to be honest, down right bad-looking, Mind you, if any of you are crazy enough to pay me over $250.00 US for it then please email me by all means. I wouldn't say no to 500% profit. :-))

Hey hey hey all!
Lets not kill each other over nothing people. There isn't any
intention to break any laws - whether they exist or not. This
equipment is much too expensive for my budget whether its' obsolete or
not.
But then again, if it is obsolete then these people selling it are -
what? stealing?, defrauding? whatever.
In any case I'm curious to know about many things and this just
happens to be one - that's all. Not more than that. Got some e-mail
with an ad, that sparked my curiosity.
The internet is supposed to be the "ultimate" medium for the free
exchange of ideas, idle or otherwise. Took me 20 years to learn how to
cook 'steel cut oats' properly without the internet. You'd think that
it could have been less painful via the internet - but then again -
would it have??

Still curious
As always
BoP

2588. Re: Weather Radios

Newsgroup: rec.radio.scanner

Message-ID: <AY%z8.61$ce4.5496@newsread1.prod.itd.earthlink.net>
Source record: 48804

. . . if you think it's too long ... you don't have to read it :) . . .

Chris and group ...

I hope that I may add a little bit of information to this discussion and provide some general information on NOAA weather radio to other readers. I am a professional broadcaster, student meteorologist, and a scanner user.

Over the years, I have had the opportunity to use (and install) many types of weather radios / SAME & EAS decoders, from portable hand helds to professional Emergency Alert System receivers/decoders.

First, as I'm sure you know, there are two alert 'trigger' methods available with consumer NOAA weather radios: the older 10-second analog 1050 Hz tone trigger, and the newer digital Specific Area Message Encoding trigger.

The older 'tone triggered' radios will alarm for (any) alerted warnings for ANY county served by the transmitter the radio is monitoring, since the special tone is still included in the NOAA weather radio audio stream.

This older tone immediately follows the broadcast of the digital SAME information which is contained in a digital data 'burst' that is repeated three times. Within EACH of these bursts is contained a code which defines the type of message (SVR storm warning, TOR nado warning, etc.), the warned geographical area (usually a FIPS county code), and the expiration time of the warning / message. While all SAME radios allow the selection of particular county code, not all allow for selection of warning type. Even on those consumer versions that do, I don't believe they allow for deselection of Tornado warnings.

Unfortunately, it has been my experience that the tone triggered radios are more reliable for PORTABLE operation in fringe reception areas. While the SAME header is repeated three times, I have found that many portables still miss this data, especially/mainly while the radios are in motion inside a vehicle, and fail to alert.

Most tone triggered portables, on the other hand, need to only receive a brief portion of the 1050 Hz tone in order to alert. In this case,
the tone is either there, or it isn't, and there is no digitized data that can be missed or falsely decoded.

As far as the better brand of SAME radio, I have actually always trusted Radio Shack's, even though I did have one completely fail on me once. It at least told me something was wrong, with 'Check Op' appearing on the LCD display. I have personally returned two properlly programmed non-portable

Midland SAME-capable radios for what seemed to be selective failure to alert (a RS brand also in my home with equal reception still alerted). I have actually thrown away a handheld Oregon Scientific SAME-capable portable radio for similar failures.

By the way, Oregon Scientific and Midland are the only brands of weather radios with recall information that I have found on the U.S. Consumer Product Safety Commission's website (http://www.cpsc.gov/). The recalls were, I believe, voluntary.

The tone-triggered radios with selectable 'channels' (1-7) all seem to operate with great consistency; Midland's seem to have the best reception; I depend on my Oregon Scientific ** tone-triggered ** handheld for portable operations. I would, however, stay away from those with a 'dial' tuning system similar to older car radios / stereos, as reception tends to drift up and down the dial, with frequent retuning necessary.

Sorry to ramble ... hope this is helpful information to someone.

Mike Grogan.

2590. 2052 Programming question

Newsgroup: rec.radio.scanner
Date: 2002-05-02 02:33:43 UTC
From: Chairborne <Chairborne@lzboy.com>
Message-ID: <f091dus663k0btel6814rgteql8e1lleeq@4ax.com>
Source record: 48806

I've been using a couple of the cheaper programs. One has comma delimited data, the other has column delimited. I have yet to find a way to simply cut and paste data into either one, using Excel. Either I lose the "punctuation" (the quote marks and commas or semi-colons) or the column width is incorrect. Excel seems to interpreting tabs into everything, even though I tell it it is not tab delimited.

Does anyone have a way to do this?

2591. Re: Weather Radios

Newsgroup: rec.radio.scanner
Date: 2002-05-02 03:16:24 UTC

Source record: 48807

The only thing I would add, is that SAME works, as long as you select the correct frequency. The NOAA website explains this well, but the radioshack literature left a bit to be desired. I can put county codes in all day long, but if I tune to the weather reception for a neighboring county (I am on a border where my county is broadcast on a freq different than the county 10 miles away) the code will never work.
Now, my wish list.. my radio will monitor multiple codes, now if I could only get it to monitor multiple freqs at the same time.
As it is, I'll be using the neighboring county's code, since they are southwest of me, and 10 miles out.

Why are we broadcasting the Police, Fire and EMS Radio Transmissions ?

General Public Interest : There are many people interested in the workings of the communities Public Safety Departments. Scanner sites are located throughout the United States and Canada that broadcast their city's Police, Fire and EMS dispatch transmissions. We decided to join them.

Appreciation of the Public Safety Departments: Few people realize just how busy both the Public Safety Departments can get, especially during the day. The broadcasting of the dispatch gives you a picture that the spending of your tax dollars on the safety of our city is well worth it. The one thing that should stick out in your mind is the professionalism of our Police and Fire Departments. Under sometimes stressful emergency situations they remain calm and fully under control. That is the sign of a well trained department.

Listen to Live Public Safety Scanners online from across the U.S. and Canada.

Place your scanner online and let us know about it.

Police, Fire, EMS, Tactical

If you are looking to learn how to either broadcast or listen to online scanners from Across Canada & The U.S. Then I would like to invite you to join our discussion group.

I just use that old 1000hz tone radios. That way I can hear that warnings comming to me as well as going away from me. The SAME works but the transmitter in my area screws the codes up a lot.

No problem. It was well worth the read. On another post (which has not yet been posted) I said I had the Uniden BC278CLT AM-FM-weather-scanner-clock radio. I have not used the SAME feature, becasue I, uh, never actually got around to reading the instructions. Uniden has owner's manuals on its website in .pdf format, so you could check out this radio's capabilities in advance.

Too bad. I mean, that is was discontinued, not that you own one. OTOH,
doesn't that mean that it will be available several places online for
a fraction of its original price? The manual is still available at
Uniden's site, it costs $7. You can download it for free as well, at
http://uniden.com/productsupport.cfm?product=WX100 . The radio is not
even available as a refurbished unit. Sorry.

If you were really sorry, you would put all your stuff in
one post.

If you were good, you would create a for sale web page and
direct everybody to that. You can update the web page with
what's been sold, and put new stuff on it at will.

Regarding portable alert radios, you make a good point about tone vs. SAME alert. FWIW, a year or two back, at our annual spotter training class, the NWS MIC was showing off his portable wx radio, which was the Oregon Sci. tone-alert model, not the SAME alert model. Makes you wonder what he knew?

As an aside, I have a Radio Shack 12-254 portable SAME alert receiver which I modified for mobile use by removing the whip antenna and replacing it with a short piece of coax and female BNC connector, hooked to an external antenna. Very handy when out sv wx spotting.

Very nice presentation, Mike!

Mark

Hears some more frequencies for Millvlle airport, NJ
123.65 CTAF (tower?)
123.000 Unicom
124.600 App/Dep
128.125 ASOS
122.75/238.15 arrival aircraft parking and look for the AIR BOSS here!
The web address for the show is: <http://www.schultzairshows.com/millville2002.htm>
More air shows are at <http://www.aero-pix.com/schedule/sched2002dt.htm>
you can still listen to the T-Birds on 141.850 Mhz in AM with an FM only radio, it
will sound tinny and staticie.
If your using a radio that has selectable AM-FM modes then it will sound OK.

What is the first i.f. freq of the scanner? Could be images. See if you hear the same signals in the lower 900 MHz range.

Are you sure you're hearing cordless? Do you hear the conversation to the end without it switching to another freq?

BTW, you're under arrest!

SB, take a real GOOD look around. Now tell me that the majority of posts are not useless regardless of what newsgroup you are in. The majority are just stupid and just uncalled for. The responders to the original post always vary from the main subject and end up looking like a dud. Yep, just like this one, my response has nothing to do with the subject at hand.

SB wrote:

Under arrest, ya? That will be the friggin day. The FCC can't enforce real violations of the communications act. Heck, you have cb'ers running high power amps, whoever transmitting on ham bands, cops using so called frequencies there are not licensed on for surveillance and a host of other violations of the communications act. And you think the FCC is going to be concerned about John or Mary Doe monitoring telephone calls on their scanner, I don't believe so.

Listening to wireless telephone calls is like listening to any two way radio, if it's broadcast on the air waves it's open to all. Frankly I don't get a swelling in my drawers over listening to phone calls. I use a cellular phone at times, you may not want to hear what I have to say.

Hmmm.... you guys have almost talked me out of buying a
SAME model and sticking with the old style tone models!

Should I do that or not?

2625. New search options at radio-portal

Newsgroup: rec.radio.scanner
Date: 2002-05-03 12:33:26 UTC
From: Willi Passmann <DJ6JZ@compuserve.de>
Message-ID: <aau06qath06$1@news.t-online.com>
Source record: 48841

The search engine radio-portal
http://www.radio-portal.org
was restructured completely. Now the following search options are at
your disposal on the start page:

Detail Search:
Here you may enter several search terms, which can be combined by the
operators
exact / and / or.
These functions offer the opportunity to adopt the selectivity of a
search. This is a great improvement compared to the previously used
routine. Now your search phrase does not have to fit exactly the
text in the database to get a usable result.
Additionally, a search can be restricted to one of the 63 categories.

Category Search:
These option corresponds to the former "Search in broad". Here you can
combine two of the given categories by the operators
and / or / not.
For example 'Reviews' and 'Antennas', to get an impression on choosing
one's own equipment.
This search routine is extremely useful to get an overview on a field of
interest - a search phrase is not necessary.

Advanced Search:
On a separate page all functions mentioned above can be combined at the
same time. So it is possible to restrict the number of results to a
senseful value or to find entries belonging to various search phrases or
categories.

I am currently working to enable a search within results pages as a
further option.

You will find further explanations and operating examples via the "FAQ"
Button.

The Classified Advert pages have been updated also. Here you can offer
or search for hobby related items.

I hope you will like the new options. They are meant as a help to find a
quicker way to radio related information. Meanwhile more than 34.000
pages are in the database - all of them were checked manually. Probably
one of the reasons, radio-portal got the Millenium Innovation Award by
Radio Netherlands Media Network in the year 2000.

Your comments will be appreciated.

Regards, have a good weekend.
Willi Passmann, DJ6JZ

Is this a joke?

Go to this link:
http://www.ripe.net/perl/whois/

and look up this IP address (the IP address of the hostname in
question):
193.2.98.10

and you'll see who this address belongs to.

Then send them an email and ask them where the server is. The reverse
IP lookup returns a host named wet.kiss.uni-lj.si. I didn't look at
the site (since I think this is a joke) but based on the name it's
probably not suitable content.

I'd have listed the information on that IP address myself, but as the
page that displays has a copyright notice, I thought I'd better not.

Good Luck.

The MRU-2 will most likely be for a 10.8 mhz I.F. circuit, and should work in most Bearcat crystal scanners (Bearcat III, IV, etc.). The MRU-1 is for Regency and most other scanners.

The U designates UHF band.
A V would be VHF-high band.
An L would be VHF-low band.

MRU-1 is for Regency scanners with 10.7 MHz IF
and will work in most (not all) Radio Shack
scanners
MRU-2 is for Bearcat or JC Penney scanners with 10.8 MHz IF
MRU-3 is for Sonar scanners with 10.7 MHz IF

I published a large chart of scanner crystal designations
in August 2000 Monitoring Times magazine, but
didn't include MRU-2 or MRU-3.

On Fri, 03 May 2002 11:12:52 -0500, Jim Peters wrote:

i found that radioworld.ca gave me 2 different quotes (apparently more
than ONE person receives email requests to sales@radioworld.ca)

i also found that burnabyradio.com had the better price, but an
unblocked IC-R3 just isn't what i thought it would be...

i wanted to receive video signals in the 434Mhz range, but according
to everything i've read, the unit is NOT capable of receiving video on
that frequency - just ATV at 900Mhz or above...

while i can still buy a 900Mhz nanobug from supercircuits.com, i was
interested more in the 70cm nanobug - but since the Icom R3 can't
receive the ATV video signal at that frequency, why bother?

i'm also running across varying reports of video signal sensitivity at
900Mhz and above - something like "you have to be in the same room as
the transmitter" to get the video signal.

it also sucks that you can't get "wild feeds" from news choppers and
such - since they seem to use a different format than Wide FM Video
Signal (someone mentioned they use VBM or some such format....)

anyway, thanks for the suggestions - i might just buy an export IC-R3
one day (once i sell my export IC-R2!)

Looking to sell or trade a Alinco DJ-5T Dual Band HT with high output battery, AA battery case, charger, Diamond Tri-Band antenna, original box and manual.
Will take $200 or will trade for a Icom W32A and will give some cash to boot.

Sam

John, that is going to depend on what you plan to do. If you are looking for an alert warning receiver for the home, especially if you are married, then get a SAME alert radio. I can practically guarantee that the second or third time the tone alert receiver goes off in the middle of the night for a warning that's not for your county, the better half is going to unplug, disable or physically remove the receiver from the house. A turned-off wx radio is like a smoke detector with the battery removed or an unloaded gun - WORTHLESS!! (I'd tell you about the time my old Uniden tone alert radio went off in the middle of an intimate moment with a new girlfriend, but this NG is read by all ages!) If you live in a fringe area for reception, get a model that has an external antenna connector. That way, if you do have reception problems, you can get an inexpensive antenna to improve your reception.

If you are looking for a unit to take traveling, hiking, camping, biking, etc., then go with a tone alert unit, These will activate with a weaker signal, and you don't have to worry about the SAME code for the area you are in. (Of course, you have to make sure you are using the correct NWS frequency for the area you are in. That info can be obtained on the NWS website.)

If you are looking for something to use in the car, check out the several models of scanners that include wx alerts, and figure on getting an external mobile antenna for best reception.

As you can see, different situations require different solutions. I feel the Radio Shack SAME alert receivers are a good buy. This is my opinion, your results may vary. But, as I'm the Asst. Emg. Coord. for my county, my opinion just may be of some value.

I have this uniden and a radio shack PRO-2026 model scanner and im trying to program the Uniden to receive cell phone calls ..... but it wont accept any frequencies that start with 900mhz. My older radio shack accepts with no problem. Is there some way I can modify the Uniden to receive cell phones. Or are all scanners made nowadays made to where you cannot scan those frequencies?

Ps I know its illegal to scan for calls for those internet police out there but I dont give shit and dont respond telling me how its illegal because I know already.

I bought three and returned them. The ICOM sales material was incorrect in specifying only "cellular" was blocked and I felt deceived. (Hopefully this has been "fixed"). My interest was in receiving the 821-824/866-869 NPSPAC ranges...which are definitely NOT cellular ranges...and this toy couldn't even do that in a blocked version. As far as I can tell, noone else has this ICOM "problem".

2651. Midland SAME weather radios on sale at Sams Club

Newsgroup: rec.radio.scanner
Date: 2002-05-04 17:53:50 UTC
From: leeroth@my-deja.com
Message-ID: <d0e744c9.0205040953.676b40e9@posting.google.com>
Source record: 48767
Cross-posted to: rec.radio.scanner,alt.radio.scanner,sci.geo.meteorology

Currently at my local Sam's Club (warehouse-type discount store) they
are selling the following Midland brand weather radios with SAME (specific
area message encoding) capability- i.e. you can program in the county codes
to the radio so you only get notified of what you want to receive.

Here are their (good!) sale prices:

Midland Model # Sam's Club # sale price regular price(+)
74-200 639019 $ 24.98 $ 49.98
74-210 447630 $ 29.98 $ 59.98

(+) Note: I *think* that is what the regular price was- I did not write
it down, only the sale price.

In any case, call the store and give them their stock numbers to check
on availability.

Basically, the 74-200 is a wx radio that holds 16 county codes, the 74-210
holds 20 county codes and has a clock and FM radio receiver.

The Midland website on these units at

http://www.midlandradio.com/products.asp?pid=33

Beware: The pop-ups promise links to manuals but they do not work. The Midland
site says the 74-200 is $69.95, so obviouosly Sams has a good price right now.

Try these Google links for info hunting:

http://www.google.com/search?hl=en&q=%2274-200%22+midland&btnG=Google+Search
http://www.google.com/search?hl=en&q=%2274-210%22+midland&btnG=Google+Search
(watch for line wrap on above URLs)

Note that on the Midland website the 74-210 appears to be called the WR-30 and
not 74-210 but they seem to be the same thing.

I glanced at the manual for the 74-210 it appears that you can also
program it for specific warning types. It also allows programming of
1st channel/all channel alerts- so at night you can have it just alert
for your county and in the day it can alert for all of the channels
(feature desired by weather nuts like me).

Oddly, I checked the Sam's Club website under Electronics --> Weather Radios
and they only list Oregon Scientific models, so these Midlands may be
discontinued- they had a big pallet of them right when you walk in the door
so I suspect they are trying to move them out.

I have one of the original Radio Shack SAME units... it has worked OK (paid $70 for it when it came out) and it works OK, but seems to lack many of the features of the Midlands.

My old RS unit had an interesting bug- the manual specified an 'all county code' that you could program in to save entering lots of individual counties (the Midland does too). Well, being the programmer that I am I put my local county code into the 1st position and the 'all county' code into the 2nd position. At night, I would set the switch to 'single', which meant only alert on the 1st channel code. Now, I would sleep fine unless there was a watch/warning for my specific county... wrong! The darn thing would alert for warnings that were not for my county!

At first, I suspected the (then new) SAME gear was sending out bogus codes via the NWS radio. After some email discussions with my local NWS office and some subsequent tests, it was discovered that if you used the 'all county' code anywhere in the list you enter, then it would ignore the single/multi switch and alert no matter what!! Grrrr. So, as a workaround I just had to plug in all of the individual county codes instead of using the 'wild card' code.

Lee Roth

p.s.
Sorry, the email address associated with this posting isn't valid anymore, so if emailing instead of posting please email to 'leexixroth@yahoo.com', but first remove the 'roman numerals for nineteen' from the middle of my email address.

There are so many negative reports about the R3, especially in the 2.4G wireless cam range, that I'm looking for a different solution. Is there a product that can produce decent reception in the 2.4G range? Or possibly a mod to an existing product? I heard there was a mod to a product which produced watchable video on a laptop computer. If this is true, can someone point me in the right direction?

Appreciate any and all help!

I have to agree with Mark...it depends on what you want to do. My original post was not intended to talk anyone out of a SAME radio ... just to detail my experience with them. In my home situation, I actually use a toned radio in my office so that I hear all the warnings from my NWS transmitter. In the bedroom, I have a SAME-capable radio so that I can narrow down the warnings at night.

Mike.

2657. Re: Multiple Scanners On One Antenna

Newsgroup: rec.radio.scanner
Date: 2002-05-04 23:50:23 UTC
From: Mike <room4me@rocketmail.com>
Message-ID: <3t_A8.63062$ao1.11484@rwcrnsc54>
Source record: 48773

The approach I would suggest is to purchase a diplexer for a dual band antenna which allows 2 radios to be connected to a single antenna OR 2 antennas to a single radio. It works in either direction.

I would suggest using one scanner for lower frequencies, below the cut off and the other scanner for frequencies above the cut off. You can purchase ham diplexers at any ham store OR search the net for better prices. Ham diplexers come in several configurations, but the least expensive a 144mHz/ 440mHz should do what you want. You'll loose a little bit of signal on the 144mHz output at 250Mhz, but other than the HAM 220 band and military aeronautical band at 200mHz. There isn't an awful lot to listen to there.

This setup will provide the isolation, minimizing birdies, and intermod caused by attaching two receivers to the same antenna. It will also provide the least amount of hassle in hook up. I've used this set up and it works well. Cost should be somewhere around $50.00 for a diplexer new, less of course, if you can find one used.

A cheaper method is to use cable TV cable from your antenna to a CATV 2-way splitter and hooking the two scanners together that way. Be sure you get a splitter rated to the maximum frequency you want to listen to. I've seen them cut off at 400mHz, so be aware.

The loss in signal by each receiver is about 3db across the splitter. Unfortunately, the isolation between the two receivers is only about 6db. This is why one scanner will hear birdies or other noise generated by the other.

Happy scanning.

2658. Question about the 780 XLT

Newsgroup: rec.radio.scanner
Date: 2002-05-05 00:13:47 UTC
From: Ben <manley62@InsightBB.com>
Message-ID: <%O_A8.48518$D%5.11964@sccrnsc01>
Source record: 48774

I know you can only program in the control channel for a system to make the scanner trunk track. My question is will the scanner record all the freq.'s that that system uses?

2660. Re: Multiple Scanners On One Antenna

Newsgroup: rec.radio.scanner
Date: 2002-05-05 00:33:47 UTC
From: Dale Parfitt <parinc@gte.net>
Message-ID: <3CD47C93.B1596AA7@gte.net>
Source record: 48776

I just put a couple of generic CATV 2X splitter/combiners on my network analyzer- scanning from 40-900MHz. Worst case port-port isolation was 17dB increasing to over 24 dB at 40 MHz- far greater than the 6dB mentioned. Of course, the port-port isolation is somewhat dependent on how well the antenna looks like 50-75 Ohms.

No, the 780 will DISPLAY each channel as it is active but it does not
record or save the freqs.

One could use a program like Trunker (available at www.trunkedradio.net)
to do this.

The PRO 43 is one of the legendary receivers that will cover the military UHF-AM aircraft band and with
selectable AM/FM modes. It should also work the military VHF 138-144 aircraft band in either AM or FM
depending on the user. Land mobile folks in this band are typically in FM, sharing spectrum with the aircraft in AM.
I have used a ICOM R-7000 for years to listen to air shows and a Regency M-7000 for mobile work. Got a ICOM R-2 form Grove last year, with the mail in coupon for the computer cable and us the Goran Valski <http://www.digital-laboratory.de/> soft ware to load the R-2 up, arcive freq. lists. Had a great air show season last summer.
Also us a Relm HS 200 and PRO-90. The Mass State police who work most of the air show traffic details,are
on trunking as are may folks down the cape (Cape Cod, MA) who support the Otis ANG air show.

I spoke with the Warning Coordination Meteorologist at NWS-Norman about this last year, and was told that the PTBs (Powers That Be) couldn't come up with a system for dividing up counties that would work for all areas. Apparently the PTBs want a blanket rule for everywhere. I suggested that each county probably had one city larger than the others, generally the county seat. Give that town/city a separate code all it's own, and use the existing county code for the rest of the county. Go from there, assigning any municipality larger than a set size it's own code. He liked this idea, as the other plans all involved dividing the counties into equal sections, difficult to do as the county size & shape varies so much from state to state, region to region. He was going to buck it up the chain of command, but I haven't heard any more about it. Probably a victim of the N.I.H. syndrome.

Actually that might not be the best way to divide to FIPS code for each
county. Give Harris County (Houston, Tx), for example. They sometimes
give warnings for Western Harris County, and I live in Southern Harris
County, but I still get awakened at night since the county is only one code.
Maybe the county can be divided in 4 quadrants, which could be posted on
the nws website.. or even two divisions (with I-10 the dividing line
north and south).. and Galveston County could have two, one
for the mainland and one for the island.. etc.. It would probably be best
if it was up to the individual offices how they would like to best divide
their counties.

I'm soliciting comments from 8500 owners. What do you like and/or dislike about your 8500? How is the 8500's VHF/UHF performance? When scanning, does it pause on a transmission until the transmission ends, or does it resume scanning after "x" number of seconds? How is it's LW/MW/SW performance? Is it easy to program and use, or is it an ergonomic nightmare like an AOR radio?

2674. tk120 v0.3 open source software for Yaesu VR-120 available

Source record: 48790
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave

tk120 version 0.3 is now ready for free download.

tk120 is an open source programming utility for the
Yaesu VR-120 portable receiver.

It runs on Linux, Windows, and (perhaps) MacOS X.

Improvements in version 0.3 include:

(1) The ability to read and write data to USA and European radios.
(2) Preferential scan flags for each memory channel.
(3) Data validation function.
(4) Balloon help popup windows.
(5) Support for all step sizes.
(6) Support for cleared memory channels.

You can learn about and download a beta test version of tk120
from my home page:

http://members.core.com/~parnass

Thanks to Russell Hall, Gary Kinsman, and Torsten Grochowski for
testing tk120. Jim Vincent, KC7RYD, and others helped by
sending me image files from their VR-120s.

I don't warrant the software, though it will cost you nothing.

Supporters line up behind eavedropping township clerk

Tuesday, April 23, 2002

By Helen Lounsbury
TIMES WRITER

Supporters for a Sims Township clerk accused of eavesdropping have taken a stand, circulating petitions that urge Arenac County's prosecutor not to force their elected clerk from office.

Sims Township Clerk Jennifer Maser had been scheduled for an evidence hearing on the felony eavesdropping charge Monday in Arenac District Court. Police allege that Maser listened in on two private telephone conversations last November.

But a judge postponed Monday's hearing because Maser's attorney had a scheduling conflict.The change didn't stop the clerk's supporters from turning in 50-plus township signatures on Maser's behalf at the county building.

"The Prosecuting Attorney should not have the right to supersede the will of the majority of voters in the last election," the petition reads.

Maser's attorney, James Brisbois Jr. of Saginaw, said the signatures validate his belief that the case against the clerk is politically motivated.

"It think it's all political," Brisbois said. "It's clear the victim wants
her out of office."

According to investigators, Maser overheard the victim talking by telephone about the clerk's role in a township sidewalk project. During the conversation, the speaker suggested that Maser had accepted a bribe for the project.

The victim became aware that Maser had heard their conversation uninvited when the clerk confronted the speaker to deny she'd ever taken a bribe.

Prosecutor Curtis Broughton and Brisbois discussed a potential plea agreement that involved Maser's resignation from office. The agreement was rejected by Maser and her attorney.

State law says it's illegal to use a device to listen in on phone conversations without the parties' consent. Brisbois maintains that the statute also requires the listener to eavesdrop "on purpose." Maser told police she overheard the conversations inadvertently. Her scanner broadcast the phone calls while her daughter was trying to get information about a nearby traffic accident, Brisbois said.

Maser is scheduled for a hearing on the evidence at 2:30 p.m. Monday.

Supporters line up behind eavedropping township clerk

Tuesday, April 23, 2002

By Helen Lounsbury
TIMES WRITER

Supporters for a Sims Township clerk accused of eavesdropping have taken a stand, circulating petitions that urge Arenac County's prosecutor not to force their elected clerk from office.

Sims Township Clerk Jennifer Maser had been scheduled for an evidence hearing on the felony eavesdropping charge Monday in Arenac District Court. Police allege that Maser listened in on two private telephone conversations last November.

But a judge postponed Monday's hearing because Maser's attorney had a scheduling conflict.The change didn't stop the clerk's supporters from turning in 50-plus township signatures on Maser's behalf at the county building.

"The Prosecuting Attorney should not have the right to supersede the will of the majority of voters in the last election," the petition reads.

Maser's attorney, James Brisbois Jr. of Saginaw, said the signatures validate his belief that the case against the clerk is politically motivated.

"It think it's all political," Brisbois said. "It's clear the victim wants
her out of office."

According to investigators, Maser overheard the victim talking by telephone about the clerk's role in a township sidewalk project. During the conversation, the speaker suggested that Maser had accepted a bribe for the project.

The victim became aware that Maser had heard their conversation uninvited when the clerk confronted the speaker to deny she'd ever taken a bribe.

Prosecutor Curtis Broughton and Brisbois discussed a potential plea agreement that involved Maser's resignation from office. The agreement was rejected by Maser and her attorney.

State law says it's illegal to use a device to listen in on phone conversations without the parties' consent. Brisbois maintains that the statute also requires the listener to eavesdrop "on purpose." Maser told police she overheard the conversations inadvertently. Her scanner broadcast the phone calls while her daughter was trying to get information about a nearby traffic accident, Brisbois said.

Maser is scheduled for a hearing on the evidence at 2:30 p.m. Monday.

It depends on what you want to listen to. If you want to listen to a broad range of frequencies from a variety of directrions then a discone is a good choice. I use the Radio Shack one, Icom makes a nice one too. For pulling in signals from one general direction I have used the Grove Scanner Beam, it is very directional, but you could always put it on a rotor. I currently use the Scantenna like antenna which Radio Shack used to carry and Grove still carries for the bulk of my listening which is all generally south of my house. I use the discone for ACARS work and that pulls in planes from all directions and from a pretty good distance.
It also depends on how sensitive you radio is. I use a cheapo Radio Shack antenna with my Uniden 9000 which is pretty sensitive and it does fine the Scantenna overloads the 9000.
To answer you question diameter is not a big deal, but it depends on what you want to hear and from how many directions.

Hi Fellows:

It is possible to put two antennas (1 discone and other vertical
ground plane for 40 mHz) in unique scanner???
I own Uniden Bearcat BC-895 XLT. I connected both antennas
and I get some birdies... any help???
Thanks in advance.

about
> your 8500?

Like: Easy to use, lots of channels, wide range and all-mode reception.
Dislike: You cannot scan multiple banks. Only scans one bank at a time.

> How is the 8500's VHF/UHF performance?

As good or better than any of the other radios I have. The only problem I
have had
is intermod from strong FM stations. I had to put on an FM notch filter to
cure
that problem.

> When scanning, does it pause on a transmission until the transmission
ends, or
> does it resume scanning after "x" number of seconds?

It will do both.

> How is it's LW/MW/SW performance?

Even though I have an ICOM 746, I still use the R8500 for LW/MW/SW
listening.
The R8500 is much easier to use. I do have a lot of power lines around that
limit
some of my listening on weaker station but early in the mornings seems to be
a very good time to find the LW beacons.

> Is it easy to program and use, or is it an ergonomic nightmare like an AOR
radio?

I use the software to program it. It's the only way to go with that many
channels
and alpha tags.

I would definiately buy this radio again.

Emergency Situation Report e-mail list for Pennsylvanians

PA-SitRep is a free, 100% non-commercial,
nonprofit, e-mail list and web site.

The PA-SitRep emergency traffic e-mail list is a
tool that will enable you to monitor and report on
major emergency situations throughout the State
of Pennsylvania including weather emergencies,
natural disasters, environmental disasters, civil
disturbances and threats of terrorism, major fires,
and manhunts.

Subscribers are encouraged to utilize their home,
work and cell phone e-mail addresses for receiving
messages from the PA-SitRep e-mail list.

Because messages posted to the list are limitted to
situation reports of MAJOR emergency situations
within the State of PA, message volume on
PA-SitRep is EXTREMELY low.

PA-SitRep is also building a list of PA-SitRep
Contacts, most of whom are Amateur Radio
Operators (http://www.pa-sitrep.com/contact.htm).

PA-SitRep Contacts monitor our higher volume
SitRep/Discussion mail list and post situation
reports ot the discussion list and to the main list.
PA-SitRep Contacts also submit their contact info
for our site and may be contacted for a first
hand situation report should an emergency
situation arise in their area.

Please visit the site to learn more:

> looks like 50-75 Ohms.
>
> Dale W4OP

I presently have 12 scanners being fed from a single VHF Cushcraft
Vertical Dipole fed into the house via RG6 Cable (about 45 feet). In
the house it goes thru a Walmart-purchased 20db TV Preamp
(30mhz-950mhz which I haven't mounted at the antenna yet) and then
into 1 two-port, 1 four-port and 1 eight-port CATV splitters going to
the various scanners all fed with RG6 (75ohm cable). It lookes like
this:

ANT--->Preamp---->Two Port-->Scanner A (triple conversion scanner)
(+20db) splitter(-3db device)
|
|
V
Four Port -->Scanners B,C,D (triple conversion)
splitter(-7db device)
|
|
V
Eight Port -->Scanners E,F,G,H,I,J,K,L. (double)
splitter(-12db device)

The total splitter loss at the output of the 8-port splitter is
22db or 3db+7db+12db approx. Counting the preamp, the loss is only
approx 2db.
I don't have a clue what the loss of the RG6 is. Antenna gain is
probably +0db at VHF to a roaring -20db or less at Low Band and 800mhz

I used the loss in the splitters to protect the more intermod-prone
radios.
I have had minor problems with birdies but none that effected desired
reception.
The other plus is that I live in an area that doesn't have big
transmitters
nearby. I also had to use a single radio shack 6db attenuator on one
radio that just heard too well. I realize this is a more than
somewhat non-purist antenna & transmission system, but it works fine

and was pretty cheap. My next improvement is going to be either a discone or a scantenna although I'm presently getting usable 800mhz & 42mhz reception.

That's the problem, the PTB's apparently don't want that kind of authority
at the local office level. They want a blanket rule for every NWS office in
every state. Of course, as any sensible person knows (government
bureaucrats don't fall into this category), one size doesn't fit all. I
merely offered a suggestion for a compromise rule that might be workable for
a majority.

Mostly depends on what frequencies you will be listening to and how far away
you want to listen. I bought a telescoping antenna from Radio Shack with the
center coil and attached it to my base scanner and can hear everything I want
to hear and more, as far as 30 miles away.

Hi Michael.....first, explain in detail the kind of antenna the landlord said you can set up. Is it a long wire for HF? There are lots of different antennas you can make for a scanner. Unfortunatly if you can't put anything up that will be somewhat visible, AND you live on a ground floor you may have to make do with the telescoping whip that came with scanner. I live in a condo and i have a Bearcat 895 xlt. I drilled a hole in top case of radio, and installed a commercial dual band whip. It looks funny but KICKS ASS. I just ran the short length of coax to antenna terminals in rear of cabinet and soldered it there. The antenna has about 5db gain on vhf and about 3db gain on uhf. It was a ham radio antenna i used years ago that i had hanging around. Since the vhf portion of the antenna was a 1/2 wave, the small groundplane [metal] of scanner top cover was OK. And since uhf doesnt require a big groundplane, the uhf portion sees more thsn enough of a groundplane in the top cover to radio and works real nicely. Any way describe what you want. can you run coax thru a window? is there a tree nearby? can you get access to the roof? You can build a real simple 1/2 wave groundplane out of a coat hanger and a short length of coax. you will still need to run some kind of feedline thru a window. Cut 2 pieces of coat hanger wire 19" long. straighten them out best you can. scrape about 1/4" of the ends till you hit bare metal. some coat hangers are coated with paint or some kind of laquer. Next get a small piece of wood or plastic about 6" x 2" and maybe 1/8" or 1/4" thick. Secure the metal perpendicular to each other, separated by about 1/2" to the plastic/wood piece. solder the center conductor of a piece of coax [25' for example] to one end of coat hanger wire, where they both meet, remember separated about 1/2" then solder the braid to the other wire end. seal with weather proof material. put the proper connecter for your scanner on the end of coax that will go to scanner. You can secure this to the side of house, in a tree, on a pole....just dont let it touch anything. it will work very nicely. use good quality coax! Also look on internet and search for homebrew antennas for other ideas...bob

There are no angels here. It's too bad, really, because I'd love to see the part 15 regulations thrown in the trash heap. The concept of privacy on an ISM band (47CFR15.9) is a contradiction in terms, indefensible, and mind-numbingly stupid. This isn't a good court case to prove the point, however.

Sigh.

One of the most important rules of SIGINT is protecting your sources. Even during WWII, Bletchly Park was hesitant to give important information to commanders in the field for fear the Germans would figure out that ENIGMA had been broken.

In the case of cordless and cell phone listening, nobody will know you are listening unless you open your mouth or are out in public with your scanner on full blast. I've actually seen a guy at a hamfest a few years ago walking around with his scanner on, volume up full, listening to cell phone calls. I don't think he got busted, though, but could have easily been nabbed for wiretapping if anyone wanted to raise a stink about it.

> higher the better but like I said is diameter important?

Diameter of a single element, say, the vertical element in a ground plane, isn't really important. You can use a thin steel whip or a thick piece of conduit and probably won't notice any difference whatsoever. The important part as far as thickness of elements is concerned is durability. An antenna with thick elements will stand up to the wind & hail better than an antenna with thin elements. I've got a military surplus discone that has thick steel elements that survived golfball-sized hail. The downside is that this antenna weighs around 10 pounds. However, I've got one antenna up that's made of a broom handle & wire coat hangers, and it's survived quite well so far.

Hello,

Does anyone have any experience with suction cup antennas? How effective are they? I live in a condo and I don't really have room to mount a huge Scantenna so I was wondering if this would be a good alternative.

Thanks!

I've got one that I got with my BC-700A. I really haven't used it all that much, but it does seem to perform OK for most scanner listening. It is basically a length of coax with a BNC connector at one end, and two suction cups at the other end. Between the suction cups is the actual antenna, being a length of wire roughly a foot & a half long. I don't know what happens to the shield braid at the antenna end, my guess is that it's just "floating."

> said you can set up. Is it a long wire for HF?
He said I can stick thin wire outside along the building, this I guess
leaves me with either a longwire or random wire which I already got set-up
for my Icom R-75. I doubt this is too suitable for 30+above listening.

> Any way
> describe what you want. can you run coax thru a window?
Yes, this is no problem

> is there a tree
> nearby?

Yes, I was thinking of doing some digging, run coax out of my window to the
ground, stick it underground to the tree which is about 80 feet away, then
string up some kind of wire on the tree - I know this would work for HF, not
sure how good it's gonna be for VHF and UHF
>can you get access to the roof?

I wish..

Uniden shipped one with the BCT-7, and I use it in my car. It's great because I just pull it down from the window (or leave it because you can't really see it). Would be cheap and easy to make (the braid does float as Tom guessed in another post). It works about as well as a rubber duckie held by the window.

If you have a deck / balcony, you may want to use a mag mount one outside. Getting anything outside the building helps a lot. If you could find something metal to set it on, it may help (i.e., ground plane), but it should still work OK even if you don't.

Then you can also target the antenna for the freqs you are interested in. Here the public safety is on 800Mhz so a mag-mount cell antenna would work well. If you're scanning lower freqs ~27Mhz, you could try a CB antenna, etc.

-Lou

GRE Super Amp Question

Have a new BC780xlt and also the GRE (3001 Base model) is new,here's the odd problem that I am wondering if anybody else has had......the GRE when you cut it on kills the audio on the scanner,you can see the bars on the s-meter go up but nothing on the audio....I've tried it scanning,and I've tried it with the standard weather channels up here where I live(162.***) and I can get all three,of course they go from strong to weak,but it does the same thing on them also.The scanner and amp are most definitely hooked up properly and I've tried it with a brand new battery.Tried it with the walwart.Tried it with both at the same time,and still the same thing.....grounding has made no difference whatsoever....does this sound familiar to anybody in the group at all,and if so was the GRE faulty or did you figure out how to fix it......ANY HELP SINCERELY APPRECIATED

Sounds like the antenna is picking up a very strong signal which is either overloading the amp, or which, after being amplified, is overloading the scanner. This is a fairly common problem with the use of such an amp. Typical sources for such a strong signal would be: a nearby FM or TV station, a nearby pager transmitter, a nearby cell tower.

Solution would be to first identify the offending signal. Then devise a solution based on the frequency of the signal. Typical solutions would be to use an antenna which is not responsive in that frequency range, or to insert a trap or block which keeps that frequency out of the amp. Or, to not use the amp.

> Wow, well at least you have SOME priviledges. You should be able to do OK
with a wire strung from your window to that tree. You may want to
investigate a wire tuner. MFJ used to make them. You will need to tune the
wire for best reception. otherwise it will recive well only on a section of
the spectrum that is relative to the wire length. But a scanner antenna
should be no prob if you can get one of those little groundplanes that radio
shack sells. stick it up in tree as high as you can. run coax down tree,
bury underground and run up side of house to window. I did this in a place i
lived once. bob

You're most likely hearing images of the signals in the 800 MHZ range.
Images can usually be found with the following formula for double-conversion
scanners: Image freq=Freq+(2*IF). Freq is the freq of the signal you want
to listen to. IF is the IF frequency, normally 10.7 MHZ. Of course the
ability to hear images also depends on the filtering & circuitry of each
different model of scanner.

2749. Re: Change of group name? Old Frequency Directories

Newsgroup: rec.radio.scanner
Date: 2002-05-08 01:52:49 UTC
From: Jim Mac Donald <jmacdon@mitre.org>
Message-ID: <3CD884F1.3523B252@mitre.org>
Source record: 48616

Mattster;
Here's another possible source of old paper/book frequency directories, where out dated, expired license info can be found: try your library, if they do inter-library loans
you may be able to have one sent to your branch. Go over to the other library if its a "REFERENCE US ONLY"
book that isn't loaned out and thumb through it for the folks your looking for. The Betty Bearcat series is a
great source ,Scanner Master directories and of course Police Call are names to check for.
You may also want to do a search on E-BAY to see if any directories are up for auction or do a Want to Buy
(WTB) post here and on the frequency board at <http://www.strongsignals.net>

Another way is to us the SEARCH function on the scanner radio, try to keep it under one (1) megahertz and
search around the repeater output, also the moble/portable and base Input frequency, for other activity.
Another place folks have been reported working, in the hobby press, and as hiding out is on the business band. Do a search after dark and late at night to see if any interesting comms show up.
Once you have come up with new frequencies and I us this site to do further checks on Cityfreq.com stuff, go to the FCC at
<http://svartifoss2.fcc.gov/cgi-bin/ws.exe/genmen/index.hts> and cross reference the new or unknown user and freq. hope this helps.
Jim

> is it possible???

As sure as I say no, someone will prove me wrong. I would think that this would cause a really bad mismatch, probably even make the whole set up directional. It's possible to run multiple identical antennas using some sort of switching and co-phasing equipment but it will not be as simple as using a t connector. As a retired truck driver I never had real good luck running properly co-phased antennas on CB radio gear, always had better reception with a well placed single antenna right up behind the cab. If you are going after a distant signal try a beam antenna, even a tv antenna mounted vertically.

Hey gang,

I bought a couple of scanners mainly for picking up ATC traffic to help me prepare for my private pilot license. Since then I've been bitten by the bug and bought a few more scanners and generally played around. After a couple of months of listening to local goings-on, I am bored. What is the next logical step?

I am interested in looking at receiving (and decoding) data transmissions. Weather satellite stuff, any data relating to law enforcement, military, or aircraft operations.... heck, I'd even be happy looking at the rain meter statistics off the funky meter I pass every day on my way to work, if it took some building and tweaking to decode the signal.

I've surfed around a bit and came up with more data types than I ever imagined existed. Of course some day I'd like to be the guy with a dozen scanners and a dozen TV's or dumb terminals connected to them picking up stuff from all over the world, but at the moment I haven't much room or time and I'd like to start small.

Although I do still enjoy listenting to my scanners, what is the next logical step in the maturation process here?

Thanks!

Could you give me an example, for instance, I hear conversation at 971 mhz.
How do you get from a frequency in the 800 mhz range to 971? Image Freq=
971= Freq+(2*10.7), gives Freq = around 950 mhz (cell in 800 mhz range?).
Does this phenomenom occur with 900 mhz cordless, too? Could this indeed be
an "image" of a cordless phone?

Anyone that uses a phone that uses 2 way analog radio (walkie-talkie) is consenting to being listened to though...

In article <mqradukprdg7dlq9dqagg0ig85hcup7210@4ax.com>, MESKI <skii@home.com> wrote:

> State law says it's illegal to use a device to listen in on phone

Thanks for the info, but there is not a bid on the item. It is just the
starting bid placed by the seller, and more than likely will not sell for
that amount.
I think that $40.00 is too low for a like new scanner.

Ed

Believe it or not, there is a federal regulation against it. Title 47
of the Code of Federal Regulations, Part 15, Section 9. Or if you're
lazy, here's an official US Government link:

http://frwebgate.access.gpo.gov/cgi-bin/get-cfr.cgi?TITLE=47&PART=15&SECTION=9&YEAR=2001&T
YPE=TEXT

I really think the regulators at the Commission were suffering a
cranial-rectal inversion of the first order when they wrote this.
However, they may not have had much choice. Congress has forced their
hand on similar issues in the past and I suspect that this may have
been the result of yet another "feel good" piece of legislation.

Sigh.

Yup, and not a single bid.. I don't blame anybody.. I would never pay that much for a 350A Things are a bitch to program, and they don't cover anything above 512MHz. Here is a link to an auction for the highest price paid for one these recently... I would even have paid that much for it...

Well, even though the law may not agree with the above comment, I'm sure
there are a lot of people who would. I for one would. If you transmit
radio waves in the open, they are there to be received by whom ever has the
ability to do so. Whatever may be contained in those waves, be it voice or
whatever, are there for the receiving. If a person decides they want to
listen, great, if not, move on and find another transmission. If people
REALLY didn't want to be heard, they would take the necessary steps to see
to it they were not.

The publics NEEDS to be educated... Too much stupidity in the world these
days...

I've got a Pro-2006 and when I program a "LIMIT" search, I can squelch it enough that it runs through the channels of my LIMIT search range just fine and stops on active channels, then continues as it should. My problem is when I actually PROGRAM channels into the unit. Normally, you would PROGRAM your freqs into each of the available 400 channels, then hit SCAN to scan through your programmed channels. Problem is, I cannot squelch it enough that it will move beyond the first programmed channel. Even with the squelch knob in the full clockwise position, I still hear a little static and it won't move beyond that channel (most of my programmed channels are in NFM mode).

Any idea why I can scan through the same freqs in a LIMIT search (because I can squelch it just fine) as opposed why I cannot when the freqs are actually programmed into the first bank of 40 (or any bank for that matter).

Thanks for the help.

MCSO now operates on the 800Mhz Digital radio system (few analog talkgroups). Southwest Ambulance bought a few of the freq's vacated by MCSO and the others are now licensed by the Az DPS. For more information check the ArizonaScanner email list at Yahoo Groups.

JA Moran wrote:

I don't have a manual/schematic here but there is probably a pot on the circuit board to adjust the squelch threshold. Just a thought that came to mind.

It could be. Most cellular images in scanners I've owned appeared at around 900-920 MHZ. I'm not sure why you'd be hearing something at 971, unless the cellular signals were mixing with another signal that is producing intermod. Perhaps the cellular signal is mixing with a local FM station.

As far as cordless phones are concerned, they operate from around 902-925 MHZ. You could be getting an image from one, but I can't work the math to put either cellular or cordless phones into the right frequency range.

directional.

Depending on what kind of antennas were being used, I don't think a mismatch would be that big a problem. However, you are right about it being directional, unless one antenna was mounted just above the other. If they're mounted at the same height and close enough, you probably won't notice much directivity. Also, if they're very far apart, like over one wavelength or so, you probably won't notice much directivity either.

Alternatively, you may try mounting a coax splitter such as a TV cable splitter and isolating each antenna. Where some people connect one antenna to two different scanners, you could turn the splitter around and try it that way. I don't know if this would negate any directivity caused by the two antennas or not. Perhaps someone else knows the answer.

That's a bad analogy. Perhaps a better one is, if you are in a public place
and having a loud conversation with someone sitting next to you, don't feel
bad if people listen in. If you want to keep information private, it's up
to you to keep it that way, not up to everyone else to not listen.

I'd say the BC780 would work in just about any system other than digital, and certainly would work on conventional anywhere (provided they are in the US). There isn't anything else out there that compares for the price, and realistic doesn't have anything comparable either (to those that don't like the B word).

From: Bob_Parnass_AJ9S <parnass@megsinet.net>
Message-ID: <3cd9e3c6$0$1419$272ea4a1@news.execpc.com>
Source record: 48660
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Your PRO-2006 might be receiving intermod or interference
from an off frequency signal when it is listening to
the frequency on channel 1.

Is your PRO-2006 receiving interference from your computer
or monitor?

The PRO-2006 contains a "window detector" circuit,
which Radio Shack calls Zeromatic.

It prevents the scanner from stopping on off frequency
signals while searching. I don't think it is active
while scanning memory channels. That may explain the
why your scanner stops during memory scan but not
during a limit search tuning the same frequency.

Has anyone added a discriminator tap? Readjusted the
discriminator? Modified the radio?
An improperly aligned or malfunctioning discriminator
can interfere with window detector and squelch circuits.

.....
.....
Tom,
A buddy of mine is a ham and he messes around with all kinds of circuits and whatnot.

He let me borrow (actually I kept it for 7 months ;-)) a little box that he would use for kicks to zap people on their phones.

I told him that it was rather childish......BUTTTTTT.....I have to say I had a great time playing with that....lol.

What is it that was in that little project box??

What's funny is EVERYONE did the same thing when their signal was cut off, eveyone ALWAYS looked at their phone. :-)

You had to be rather close. For instance....if you were in a Frischs restaurant and you were by the entrance and someone you wanted to zapp was on the other side of the restaurant you would have to go to the area by the salad bar.

It never once failed to work, I would know that by seeing the person look at his phone. ;-)

What all does it entail to put one of those together, not that I would own one of course. ;-)

Anyone have any experience with the Nil-Jon Super M or the Comtelco dual band low profile models?>>>

.....
.....

The Nil-Jon is hardly *low profile.* You could go with the magnet mount antennae at Radio Shack or their *thru the glass* mount cell look-a-like antennae.

Both are pretty good performers.

Back to the Nil-Jon. That is a pretty nice antennae, if you can get by the looks part. But in my "fun car"....the more wackier and outlandish the better. ;-)

2800. 900 MHz mobile phone frequencies? HELP?

Newsgroup: rec.radio.scanner
Date: 2002-05-09 04:54:46 UTC
From: jda1973@juno.com
Message-ID: <1e03df94.0205082054.59a6b0af@posting.google.com>
Source record: 48666

I have a list of the frequencies used for cordless phones on 900MHz.
The problem I am having is when I try to program them into my scanner
(PRO-90). The first one goes in just fine, 902.100, the second is
input as 902.130, but when I hit the enter button the scanner changes
it to 902.125. Next I input 902.160, and it is changed to 902.1625.
what is going on here? I understand that the scanner must be set of
this type of frequency spacing but will the "round off" frequencies
work? Are the frequencies I have inacurate? Please Help!!

2801. Re: voice scanning boring, next step?

Newsgroup: rec.radio.scanner

Source record: 48667

There are plenty of things you can listen too with even a basic scanner. Besides ATC like you have been hearing, I have also heard the airport weather (kind of like NOAA, but just for local air conditions), what I assume to be airport security (I live not too far from the International Airport in my city), various police agencies in Sacramento and Yuba counties, including the CA State Fair police at Calexpo, who are very exciting and don't have much code talk. Also fire, paramedics, live tv and radio remotes for both the on-air personalities and technichans (these two can be quite interesting- they don't go off during commercial breaks, I have heard anchors swearing between breaks, seriously), baby monitors (depending on the monitor, you can actually hear alot of what goes on in the house, and this is legal) fast food drive-thrus (usually need to hear them at close distance), various private security (sometimes neat- I get the security for Arco Arena, where the Sacramento Kings play, and I had also gotten Water World at Calexpo security as well ... good ways to keep an ear on your favorite buildings/complexes in your city) You can also pick up tv audio including cable (which allowed me to get my first tv dx from Los Angeles- my tvs never got LA, even with better antennas), and wireless mics. Normally you have to be at close range to hear them, but sometimes they go along way, like several years ago I heard one of the carnies for the CA State Fair quite clearly, all fair long, and this is twenty miles or so away) And if you like aircraft/airport related radio, be sure to check your local TIS (Traveller's Information Service) stations, on an AM capable radio. On AM 530 in Sacramento, I consistently get the international airport's TIS, which endlessly repeats a message about parking. Over time though, the voice had actually changed from a man's to that of a woman's. TIS stations are usually low powered and short in reception range.

exactly in the US

In 75% of the world a standard of analogue trunking known as MPT1327 is in use,and that goes for the UK apart from 3 users.

so many people have seen the owrds trunkracker,brought the 780 and then asked how does it work on there local freqs,when i tell them it wont it causes a lot of problems.

regards

mind you the 780 is fantastic on everything else anyway,but,all the person says is i brought it for truntracking and it will not do the job!

It does it on any memory channel I program. Each time I hit SCAN it will increment one channel, but will not move beyond that channel unless I hit SCAN again, then it will move to the next memory location. As normal, the volume get louder as I move the Squelch counterclockwise, and gets lower as I move it clockwise, but at full clockwise position, I can still hear the "hiss" sound like you get when your on a channel and no one is talking. Again, this only happens when trying to scan memory channels. The Squelch works fine with DIRECT and LIMIT searching.

> Is your PRO-2006 receiving interference from your computer
> or monitor?

No, don't think so. It's not what I would consider "interference". Even though, I tried it with all my computer equipment turned off.

> discriminator? Modified the radio?
> An improperly aligned or malfunctioning discriminator
> can interfere with window detector and squelch circuits.

Here is what I know from reading about mods and looking over my scanner. Yes, there is a discriminator tap with a tiny shielded coax. Center conductor runs from TP2 on circuit board to a 1/8" jack on the back of the unit. Shield runs from a ground plane on the board to the ground on the jack. The discriminator output works flawlessly.

D502 and D503 on the front board are both cut. I can't remember which does what at the momemnt, but one restores freqs, and the other I think your are suppose to cut and replace a crystal to increase scanning speed. I have not been able to (easily) find or confirm if the crystal has been replaced.

Readjusted the discriminator? I don't know what that entails or if its been done. Tweaked out the gain, if possible? Again, I don't know how or if that's been done. Back in the old days I use to work with a CB shop and we "peaked" out the gain, among other things. Don't know if that can be done with the scanner and if so, if it's been done. I was going to say that maybe it had been tweaked out for more gain but, then again, the Squelch works fine on all other scanning modes, just not when scanning memory channels.

Thanks for any further help. The unit is (kindof) useless to me if it won't scan the memory channels on its own.

Well I think there are some websites that carry cell phone jammers. Some of them are base mounted units for use in buildings, and others are portable ones. They are only sold outside the US and are illegal for use inside the US, but I've heard that some people have ordered them and didn't have any trouble with customs. If you do a search for cell phone jammer you'll get lots of hits.

If you wanted to build one, I'm sure it wouldn't be too hard. All you'd need to do is transmit a signal on the cell phone's data channel. Once the cell phone loses the data signal, any calls to/from the phone are dropped and calls can't be made until the data signal is picked up again.

Hmmm... makes me think about experimenting with an old cell phone I have...

No, I'm sure the freq list you have is accurate. It's just that the cordless telephone channels have different spacing than your scanner frequency steps. Not much you can do about that, but it really shouldn't matter that much. If you program a frequency of 902.130 and it will only tune 902.125, you should still be able to hear the signal without any problem. If the cordless uses narrow FM, the channel will still be about 25 KHZ wide. I'm not sure what the spacing for wide FM is, but probably around 50 KHZ. But wide FM sounds lousy on a narrow FM receiver. Anyway, you shouldn't have any problem.

"Illegal" only because the phone companies paid off the politicians to enact a law. Typical of the
American way. Pay off any politician and you can get any law enacted. When in doubt, ask U.S.
Congressman Billy Turzan (D-Louisiana) and Chairman of the Communications Committee.

Do you have any device connected to the
discriminator output jack when the
PRO-2006 is misbehaving?

If so, diconnect the external device
and try scanning the memory channels again.

I don't think it WAS.

Seems CNN got it wrong Richard. Go to

http://www.freedomforum.org/templates/document.asp?documentID=13976

you will see the decision. It was a First Amendment battle and not
ECPA. The case had to do with a recording of the intercepted cellular
call being aired by a radio station and nothing to do with the actual
interception of the call.

Try again! :-)

Years ago before the FCC and Congress got so damn intrusive there was, as
far as I know, a universal assumption that anything which was broadcast
using electromagnetic radiation was fair game for anyone to intercept. Those
who did not want their broadcasting to be understood were free to encrypt
their stuff. But when the radio phone and cell phone industry came along
and provided the large graft that the FCC appointed directors and stooges
love to get (e.g. whenever they make a decision like frequency allocation),
all that went away so we have the restrictions to interception we now enjoy.
The FCC is a corrupt government agency.

Bud,

If you follow the link you will see this case was decided over a year
ago. Media won, ECPA not even mentioned from what I have read except
for CNN's report. Like I said, it was a First Amendment battle not an
ECPA thing.

Guess people who listen to cellular phones shouldn't record and pass
conversations on to others. Quite profound when you think about, not.

Zeromatic is not active in scan mode but a modification was published in
World Scanner Report to allow it to be switched on in scan mode. My PRO-2004
has this modification and it is helpful on certain frequencies.

> all that went away so we have the restrictions to interception we now enjoy.
> The FCC is a corrupt government agency.
>

Correct me if I am wrong Tom but I always thought that Congress made
the laws and the FCC merely enforced them. Are you saying this has
changed? Just think where we would be if the cell phone industry
"provided the large graft" to members of Congress? Whoa doggies! We
dodged a bullet there!

The radiophone and cell phone industry are mixing apples with oranges
and are separated by centuries. In 1934, the Radio Communications Act
said you were not to divulge any communications you listened to. If we
the listening public had followed that 1934 law ECPA and its
restrictions would have never appeared.

I have a pile of Popular Comm. a & Monitoring times Magazines kicking
around. Some in well, used condition, most are in excellent condition.

I am wondering is there a market for these out there, cause if so, I'll
stick them up in an auction. If not. I'll trash them.

What type of Price is good for a whole Lot of these mags.

about 53 mags in total. I think one is dating back as far as 98??

If you're interested in capturing data that the Police send to the displays on the patrol cars you need to find out what protocol there using. if it's something common like PACTOR or G-TOR you can get a Kantronics Data controller like us ham radio operators use and you'll see everything?

Yes, there are programs that will use the control channel on one radio
to 'trunk-track' on a 2nd radio.

But the cost and complexity make it not really worth considering,
when you can get a TrunkTracker for under $200.

Maybe I'm missing something but it has the May and June issue index, the airshow page has the fact that the Ottawa, Canada show is in doubt due to the cost of insurance (this was only announced a couple of weeks ago).

Just what is it that is out-of-date?

Do you have a frequency in memory location 1 which is transmitting
continuously and have the priority selected? It won't scan properly with
that type of set up.

"Gap-toothed"! I like that. It sure does describe the Alfred E Neuman grin, doesn't it? His high domed forehead only accentuates the vaguely addled look.

It is actually the Alinco DJ-V5 dual band ham transceiver with wide band receive capability.

Try Acars, a good spot to check out the software is

www.airnavsystems.com

I use the AirNav Acars decoder and AirNav 4 to get more detail and the maps.
I do not do the internet thing with AirNav but do local Acars only. I also
do SelCal with my HF radio.
Unless you are close to a major airport most the the signals you will get
are from planes in the air. I use a discone antenna with an Icom 7100
radio. The most helpful piece so far has been an AOR filter that filters
out all but the AM air range.

I even caught the Vice President's plane tonight, he was in town for a
Fundraiser.

Another good antenna, and it's REALLY low profile, is the Valor Pro-Am MM144 - it has a "hershey kiss" size rare-earth magnet, which has held for me at 80+ for miles & miles on the freeway. It comes with a black-finish 18" element, and 6' of thin RG-174U cable; that cable is pretty "lossy," so you wouldn't want to run it very far anyway... but it's great if you want to snake it into the car through any old opening. It's designe for TX/RX on the 2-meter band (144-148 MHz), and works great on VHF high, very well on UHF, and pretty well on 800 Mhz. It's only so-so on VHF-low, but it beats an in-the-car antenna by a long shot.

Ham Radio Outlet - www.hamradio.com - has carried it, and they carry it's cousin the "Iron Horse" Model # IHMM270. It's described in their catalog as "144-148 and 440-450 MHz. Magnetic Mount 1-1/8" in diameter. 9' of rg-174 cable with BNC. Height less than 20 inches. 1/4 wave on 2m and 5/8 wave at 70 cm. Black-chrome finished brass ferrule. Max power 25 w 70 cm, 50 w 2m.$37.95... but when I bought it at their Sunnyvale store about two months ago it was around $20... don't know if that was a mistake or a sale price, but I grabbed two of them while the grabbing was good.

A good general-purpose multi-band scanning antenna that I've used for years, especially when I'm traveling and want better reception of the CHP on 42 & 39 Mhz, is Radio Shack's venerable 20-032, at $29.95. It's not "low profile," but it's a decent antenna. I've used mine for transmitting on both 144 & 440 Mhz ham bands occasionally, and it seemed to work fine, though it's not designed for transmitting.

My 2

I've actually heard of freak cases, where for some reason cordless was
picked up on television. Should the person not watch their television? I
personally had freak case once with my cell phone where I was attempting to
make a call, but some how when I hit "send" I was listening to both sides of
another cell phone conversation on my phone! Was it illegal for me to hear
that? If I have a scanner, radio or what ever electronic device that can
pick up audio on perfectly legitimate and legal frequencies and through some
freak of electronic nature gets cell or cordless on it, is that a violation?
If you are sitting in a restaurant and the person in the booth next to you
is talking on a cell phone, aren't you illegally eavesdropping?
I imagine that we can all think of situations where there is a direct
parallel to electonic eavesdropping.

I finally bought my new weather alert (SAME) radio. I found the Midland (SAME) radios on clearance at Sam's (Laurel, Md.) for $39.91. (model 74-210). The radio accepts 20 SAME CODES and has an FM radio and clock. Also, high/low siren setting.

After getting it home I checked out a website to obtain the SAME codes for my area and noticed another site that mentioned "possible problems" with this model. The site is:

http://205.156.54.206/nwr/mid74-210.htm

It stated:

"If you own a Midland Model 74-210 weather receiver and have a technical question regarding this situation, you may call Jerry Finke at NWS Central Region Headquarters in Kansas City at (816) 426-3226 extension 441."

After trying to call Mr. Finke for two days (the line went dead and all I could hear was my own voice echo), I went ahead and called Midland at 816-241-8500 x220 and spoke with Dwayne, who explained to me the NWS has screwed around with the SAME format software, therefore some radios were not decoding properly. The NWS then had to go back and re program all software to correct the situation.

At the same time, my friend bought a radio Shack (12-255) and we were both waiting for an alert to make sure our radio were working OK. Then Sunday night my friend called me and

said the local NOAA-NWS station was "off the air." I got home several hours later and called them in Sterling, Va. (KHB-36) and when I asked the guy on duty when they would be broadcasting again he said, "What -- is it off?"

He then turned on an auxiliary transmitter and all was well.

Until today, I accidentally programmed a station from Sudlersville, Maryland (75 miles away that doesn't support the DC area SAME codes) so my radio was silent today, despite several warnings.

Now it's programmed to KHB-36 and hopefully it will work OK.

It's been a long week! If anyone lives near Laurel, Md. the Midland 74-210 is available for $39.91 at Sam's Club.

Also, I was told legislation is pending (just needs approval) to authorize the Homeland Security Agency to use the NWS frequencies for future use, including terrorist alerts. Did anyone know this?

(KM)

I have one and in general I'm pleased with it. Of course, HF reception is poor with the rubber duck but on VHF and UHF, it's not bad.

It seems either more susceptable to overloading or receives more spurious signals than other scanners I've had. Also, mine has a nasty habit of breaking into oscillation occasionally. This seems to happen most when the batteries are low (sometimes when the squelch opens, a loud buzzing is heard). When I press on the front of the case below the speaker, it goes away. So maybe there's a bad solder joint inside. It does eat batteries. A few hours' listening and it's ready for a fresh set. I use rechargeable NiMH ones.

It's a pain to program manually. Get the free software from Alinco's web site and either buy or build your own cable.

Your comparison is completely ridiculous! There is no comparison between walking down the street and being stabbed, and receiving radio frequencies out of the air. If you can't come up with a better comparison than that lame attempt, then don't bother posting/replying.

Like I said, the public needs to be educated on the matter... Would you talk about your recent drug deal on a 25-channel cordless phone? Probably not. Why? Because you are EDUCATED about the lack of privacy in analog voice communications. Would your neighbor? There is a good chance he/she would, unless they too are educated about the matter. There are a LOT of "stupid" (uneducated) people who wouldn't think twice about making a drug deal over an analog cordless phone. Why is that? Because they aren't educated about radio communications of course...

If you want privacy then use your head, not a radio transmitter...

Some problems have lower-tech solutions than others. I hope that
eventually, an NOAA station will be on the air, and that you can
determine whether your radio works. Congratulations.

: Maybe you need to mention this in that "voice scanning is boring" thread...

I apparantly gave the wrong impression. I still listen to my scanners all the time. Its just old news now and I was looking for something new to do with the hobby. Data seemed like the net logical step but I didn't know where to start.

Well, for starters, the person asking the question may be new to scanning, and doesn't know it is illegal to monitor cellular and cordless phones in the U.S. Also, if you give advice to someone that instructs them on how to break the law, you could be considered a "conspirator" and arrested, just look at what happened to Bill Cheek. Not saying it will happen, but it could. After all, this is a public forum. A "Screw them, I'll do it if I want!" attitude makes great ammunition for those in authority who would like to see all scanners banned. If somebody wants to know how to break the law in the U.S., feel free to email them directly with the information, no one is stopping you. As for this being an international NG, yes it is, but most (a majority I suspect) of the readers of this group do live in the U.S., so the warnings are a good idea.

The law in the U.S. forbids intentional monitoring with electronic equipment. Overhearing a conversation in public, or accidental reception of signals on equipment not designed for that purpose wouldn't count, I believe. Of course, until this comes up in court, and a precedence is set, who knows. If the prosecution can show that you were aware of the law, and continued to listen to a conversation you intercepted "accidentally", it might be rough. And all the various posts on this NG from people in the U.S. who advocate breaking the law could come back to haunt them later. Be discrete. If you are going to speed, do you do it where there is a likelihood of being seen by the police?

I have the same radio, in Fort Worth, Tx and never had a problem with it,
have had it for about 3 months, last night we has so many watches and
warnings that I was hoping it would not work, but I still want to know if
something was going on so i did not turn it off

First, CNN sucks..end of that subject. Next, I think you need a reality check. FYI my credit number information was hacked in Mar 2001 three months after I had placed several items for sale on Ebay. I was contacted by a service that monitors unusual profile purchases for VISA and MASTERCARD who noticed a non-typical purchase profile. The greedy vendors suffered the financial losses for sales made via the telephone to the hacker which were between $2,000 and $3,000. Keep this in mind the next time you supply Ebay with your credit card information. If mine was stolen, you know that thousands of others were too.

If you are referring to the ICOM R3 as a scanner with video reception capability, I would agree. Its video performance at 2 ghz. video reception is awful. Its' tuner is not sensitive and the battery life is poor. Here is another reality check. There currently is a product available for the approximate cost of a base trunked scanner that is designed for video reception and if present accompanying audio. I have one I have been beta testing mobile for over a month. It is a 5 inch tv monitor with "paddle" antenna that has a scan feature from 2,300-2600 mhz. powered by 12 VDC and it works as advertised. I have received a number of "hits" driving around area roads. I am in the process of writing a magazine article on this new facet of monitoring. Without addressing more specifics, I am almost finished with compiling a frequency database of 2 ghz. video users for all 50 states that I will offer for sale for a reasonable price hopefully this summer.. Oh, also for your and other's information, many of the "interesting" video signals are above the R3's 2,450 mhz. cutoff frequency.

I heard on BBC Radio4 (UK) tonight, that some Counties in the UK were forced to suspend the implementation of Tetra Systems due to health scares. Apparently, trials in the North West in particular resulted in a high volume of reported side-effects - so much so that the emergency services in my area (Greater Manchester) have returned fully to their analogue systems.

Any comments?

I've actually heard of freak cases, where for some reason cordless was
picked up on television. Should the person not watch their television?<<
.....
.....
I have had a small black&white tv that measures 8x4 and goes 10 deep. That was
the first time I heard someone on their phone and that was over 9 years ago.

It wasn't a *freak* case. I would hear our neighbor (at the time) talking on
the phone almost 24 hours a day.

I never would have thought I would enjoy that little tv as much as I did. ;-)

Well .....

sometimes you DO need a stronger multifreq signal to do
" special " testing with ...etc.

One " extremely " easy way to do such a thing is to buy a signal
generator from ebay. They come in several (more or less) standard
freq ranges

... 455 kc to 300 megs
.... 20 megs to 550 megs
.....20 megs to 1.2 gigs ...

etc. They come in many different types and ranges. the
more freq they cover the more expensive they are.

get one in the freq range of interest (up to 1.2 gigs)

go to the Ramsey Electronics site
http://www.ramseyelectronics.com/
and build or buy (already built) their 1 watt wideband
instrument amp. (also available from Ranbow Kits ..and many others)

hook the amp to the output of the sig gen..and presto ..1 watt on all
freqs covered by the gen. 1 watt is usually more than enough ..but if
you need more power ..bigger amps are easy to find all over the web.

2899. ANN: tk75, new open source, multiplatform software for ICOM IC-R75

Newsgroup: rec.radio.scanner
Date: 2002-05-11 03:39:51 UTC
From: Bob_Parnass_AJ9S <parnass@megsinet.net>
Message-ID: <3cdc92a2$0$1418$272ea4a1@news.execpc.com>
Source record: 48467
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,alt.radio.scanner

The ICOM IC-R75 is a 0.03 - 60 MHz tabletop receiver.

I wrote tk75, a new open source computer program which lets you:

(1) Control the IC-R75 from your computer.

(2) Download/upload the radio's memory channels from/to a
csv (comma-separated values) file.

(3) Log active frequencies, intercept time, and relative signal
strength automatically while scanning.

(4) Easily access radio controls which are buried
within the radio's menus, e.g., DSP Noise Reduction level.

Though I've all but abandoned Windows 98 in favor of free Linux,
I wrote tk75 in a language (Tcl/Tk) which permits it run on either
operating system. It will probably run on Windows ME, Windows 2000,
Windows XP, MacOS X, Solaris, FreeBSD, and other environments,
but I've only tested it on Linux and Windows 98.

You can read about and download a beta test version of tk75
from my home page:

http://members.core.com/~parnass

I don't warrant the software, but it won't cost you anything.

Thanks to Bob Grove for the loan of an ICOM IC-R75 receiver
so I could design and test tk75.

Well, since the discussion (as I understand it) relates to people requesting mods to scanners to enable cell phone reception, I don't think I'd worry about the TV. If, however, you own a pre-ban scanner and "accidentally" happened to tune in a cell/cordless phone conversation, that's another situation entirely. Like many other activities, if you choose to monitor cell/cordless phone calls in the privacy of your own home, then the only way you could possibly get in trouble is by talking about it. If you are indiscreet enough to make your activities public knowledge, if you get in trouble, you have only yourself to blame. It is not currently illegal in the U.S. to own a scanner that is capable of receiving cell calls, but if you don't think that could change, look at the states that currently restrict the use of a scanner in one way or another. A blanket ban is not impossible.

Mark

The usual BBC mish-mash of half truths and invented speculation.
Call me cynical, but I just wonder how much of all of this regarding
TETRA, is to delay it's implementation long enough for an even more
secure system, which is just about to come on stream - and is totally
(?) unbreakable - to be purchased instead.

It would be interesting if the emergency services switched to TETRA
only to have a new generation of scanners break it in a couple of
years time, whilst this later system is used by business and others
and makes scanning obsolete.

Try joining tetrauk@yahoogroups.com if you really want to know. If you follow the pap put out by (some say mischevious) non-understanding scare-mongering media you will hear what they want you to think - but if they don't understand it (and clearly they don't) what hope has Joe Public got?

I would like to know what 'high volume' means. It could mean half the force - in reallity I suspect it means at most a dozen, and how many of them previously suffered Migraine anyway? They've been using 4W radios within an inch or two of their heads for years: in the main Tetra sets do run slightly lower power but - agreed - do have a pulsing characteristic of which no-one knows the effect. The difference may be that the radio transmits on its own as the user moves around the area, but then it isn't near the head.

As for GMP their decision to revert to analogue is nothing to do with health, more from technical problems associated with radios being lost on the system, and above all coverage. It looks as if Airwave have adopted a cellular stance and gone to provide coverage in centres of population and on main routes, whereas the Police need (and already have in most cases) approaching 100% ground coverage - which is a VERY different matter. North Yorkshire (i.e. around here) seem to be using the system with success, except that user feeling is that it has been hyped up out of all proportion and over-sold.

I've been working in mobile radio for over 30 years and it's had no side effects on me yet!

Eight o'clock. Pardon?

So, if you "accidently on purpose" overheard a conversation on a scanner about a crime that had been or was to be committed, all the "legal" listeners wouldn't notify the authorities I guess. I would guess the law would look the other way in those cases.

Could someone post the exact law, etc. I'm curious if it does specifically mention cell phones, electronic communication, certain frequencies or what. There are plenty of frequencies out there that have private conversations that everyone can listen to. It sounds like the easiest way for manufacturers to "satisfy" the law was to block only the primary frequencies for cell. They failed to tell the lawmakers that we would have to give up certain portions of the television audio frequency, ham bands, etc.

What is the difference with listening in on a ship to shore marine band conversation on a "non-banned" frequency and a conversation that takes place in the "forbidden" frequency. The "image" frequency monitoring (e.g. on a television) is the same conversation but on a different frequency. I used to pick up harmonic frequencies in the ham radio bands of older cordless phones. Who's out of who's territory there?

Emergency Situation Report e-mail list for Pennsylvanians

PA-SitRep is a free, 100% non-commercial,
nonprofit, e-mail list and web site.

The PA-SitRep emergency traffic e-mail list is a
tool that will enable you to monitor and report on
major emergency situations throughout the State
of Pennsylvania including weather emergencies,
natural disasters, environmental disasters, civil
disturbances and threats of terrorism, major fires,
and manhunts.

Subscribers are encouraged to utilize their home,
work and cell phone e-mail addresses for receiving
messages from the PA-SitRep e-mail list.

Because messages posted to the list are limitted to
situation reports of MAJOR emergency situations
within the State of PA, message volume on
PA-SitRep is EXTREMELY low.

PA-SitRep is also building a list of PA-SitRep
Contacts, most of whom are Amateur Radio
Operators (http://www.pa-sitrep.com/contact.htm).

PA-SitRep Contacts monitor our higher volume
SitRep/Discussion mail list and post situation
reports ot the discussion list and to the main list.
PA-SitRep Contacts also submit their contact info
for our site and may be contacted for a first
hand situation report should an emergency
situation arise in their area.

Please visit the site to learn more:

http://www.pa-sitrep.com/pasitrep.htm

Thanks. We'll look forward to your participation.

Agreed, the rubbish spouted by the mobile 'phone mast protesters is
something that really gets up my nose, there was an article in a local
paper about the Tetra masts as well, claiming that they could 'burn out'
your car immobiliser which could cost as much as 400 to repair, the
evidence for this was one person who couldn't start his car (Chrysler
Neon) and had to have it towed to a garage who told him the immobiliser
had 'burned out' because of the Tetra mast! Reminds me of all the crap
spouted by CB users about 'me swar' and so on.

In fairness, I trialled the Dolphin Tetra system and found I got a
pounding headache after having it in the car for a day, the Motorola set
I had was good enough that it could be used 'hands free' with the
internal speaker and mike whilst on the centre console so it wasn't a
proximity thing. My normal mobile 'phone has no noticeable effect on me
unless it's used for hours a day next to my ear (and that may be because
of the habit I have of crushing it to my ear)
>
>As for GMP their decision to revert to analogue is nothing to do with

They have a lot of 'black spots' and a couple of officers found
themselves in potentially dangerous situations with no radio cover,
which is obviously a bad thing, I also seem to remember that the Tetra
implementation in Manchester has some problems with 'talk-through'

The only possible heath worry with Tetra is the TX RF is multiplexed at a 18Hz
rate
A frequency which is known to be able to cause epileptic fits if from a flashing
bright light
It's never been shown fits could be caused by RF at that frequency

I would of been smart if the Tetra designers had picked a higher frequency
like used in GSM multiplexing to avoid any controversy

Hi, Bob,

Thanks for keeping up the work on this project!

I'm curious -- have you considered moving your effort to Python?

We're starting to use Python at work and there's a significant number
of developers who think it's the greatest thing since peanut butter.
I'm not *that* bad but I am impressed. There is a tk class for it,
as well as an INI file handler class, which is really, really nice.

Funny how these things vary. Tetra pulses at 17.6Hz, but I had always understood that the frequency range of flashing light that could trigger fits was 7-12Hz as the latency of the causes anything above 12Hz to appear as a continuous source.

Question: does GSM go at a higher RF pulse rate than 17.6? After all the underlying technology is very similar.

Oh yes, GSM multiplexes at a much higher rate, up in the hundreds of Hz, I think
?
Anyone know why Tetra picked such a low frequency ??

Sorry for being ignorant, but I understand that TETRA is going to be
implemented by the police force!
I think that it is some kind of encrypted radio. I haven't in all honestly
got much of a clue, so could someone plz tell me how it works, what it is,
and can it be listened to it? Oh and anything else that's of use

Thanx in Advance

It's a lot like GSM, but on 400MHz instead of 900/1800MHz
all you'll hear is the digital buzz, as on GSM.

Hi; I had this scanner in box for 2 years never used a BC 600XLT. When I went to plug it in and use it with the supplied transformer it went on and went right out and seemed to smell like something burned. So my son checked the trnasformer with a digitial meter and it says 18 volts is coming out of center pin positive while it should be 13.8. Could it have frioed the board. It still seems to hum but no light, display or scan or audio. Is this factory repairable since it is out of warranty and what would happen to do that. Any addresses of where to send it and any ideas on what to do. Should I sell it for parts. It has the CTCSS tome and pre-amp board insatalled that was extra paying options at the time. nick

Yeah, I knew what you meant. It's always fun to keep expanding into other
areas of the hobby. I too find police comms boring at times, probably since
I work as a dispatcher, but once in a while there will be something exciting
happening, like a car chase, plane crash, etc. The only thing is that it
takes a lot of boring listening to find those few minutes of excitement.

> What makes you think breaking ONE law isn't like breaking ANOTHER law??

There's a big difference between listening to someone's radio transmissions
and committing aggrivated battery on them.

How about this analogy: My wife & I were at a jazz concert and some dumbass
& his girlfriend were sitting behind us. This guy kept talking to her all
through the concert and over the music. I turned around and asked him to
quiet down, and he got mad claiming that we were eavsdropping on him. I
told him if he didn't want us to hear what he was saying, he should be
quiet. Luckily they left before intermission.

The moral of the story is, if you don't want people hearing what you have to
say, don't be broadcasting it all over town. It's kind of like trying to
have a private conversation via CB or ham radio.

I don't know about 800/900 MHZ transmitters, but I've been told that some 6 meter ham transceivers can be modified to operate on 46 MHZ.

Disclaimer: Transmitting on unauthorized frequencies is a violation of FCC rules.

Thanks for the post.
It appears that the laws are full of holes, though. I bet the definition of "surveillance" has been batted around the legal water coolers for some time. Some probably would argue that it is "entertainment".
What it specifically states is that it is illegal to alter a device to receive the frequencies that have been allocated for the communications device (cell phone, cordless phone) to transmit and receive. So if there is a harmonic or IF that "spills over" into a legitimate frequency it should be fair game. Bottom line is that if you want a secure conversation, don't use wireless.
I still don't think there is much difference in hearing a person talk on a cell phone in a restaurant, for instance, and listening on an electronic device. Maybe we should all be walking around in our personal "cones of silence" (for those of us who watched the TV series Get Smart!)

2933. FS: MINT YAESU FRG-9600 VHF/UHF COMMUNICATIONS RECEIVER

Newsgroup: rec.radio.scanner
Date: 2002-05-11 22:11:56 UTC
From: radionurd@aol.com
Message-ID: <20020511181156.02385.00001496@mb-fp.aol.com>
Source record: 48499

I have FOR SALE a MINT YAESU FRG-9600 VHF/UHF Communications Receiver. This is an awesome unit that covers 60-905 mhz, ALL MODES (AM-N, AM-W, FM-N, FM-W, USB/LSB. Has 100 memories, TRIPLE CONVERSION, VFO, clock, timers, multi color signal strength meter and MUCH MORE! This radio covers it all! NO BLOCK IN FREQUENCY COVERAGE! CONTINOUS COVERAGE! This is commercial quality, and is in MINT - near NEW condition! If I had the box, you would think that it is new! Included is the radio, mobile mounting bracket (NEVER has been mobile), DC Cable, Wall-Wart Power Supply, Telescopic Antenna and Manual. I cannot stress the quality of this radio. You will be very happy with this. I am asking $400 INCLUDING Priority Shipping in the US. Please email with any questions! Thanks!

2934. ?? How can I scan all 7 NOAA freqs. in alert mode at the same time??

Newsgroup: rec.radio.scanner
Date: 2002-05-11 23:08:01 UTC
From: sprinkysprinky@yahoo.com
Message-ID: <8f027193.0205111508.fcbcfa1@posting.google.com>
Source record: 48500

I'm wondering if someone can help answer this question of mine.

I would like to know if there's a scanner or radio (mobile, preferably) that will silently scan ALL 7 available NOAA weather radio freqs. and will still activate for ALL weather alerts on ANY of the 7 freqs. This would mean that while I am traveling, I wouldn't need to be re-entering the nearest NOAA channel. The radio would simply be quietly scanning/monitoring all 7 channels and any time an alert was sounded for any station that could be received, I would hear it.

I already have a PRO-76 and a PRO-79 that have the weather alert feature. It works fine, but again, I can't seem to set either radio into an all-channel weatherscan mode and still have the alert feature on standby. Perhaps I'm missing something obvious; perhaps there just isn't a radio that can do this.

I hope my question is clear. Any help someone can give will be appreciated.

Hi Eric,

I, too, was swayed by the Python zealots,
so I bought 3 books on Python and Tkinter
with the intention of writing multiplatform
radio software.

But, I put those plans on hold after finding
that I couldn't use the same Python code to handle a serial
port the same way on Linux, Windows, and MacOS X.

Setting up the serial port parameters in
Python for Windows, for instance, takes several instructions.

It's merely one instruction in Tcl, e.g.,

```
fconfigure $Sid -buffering full \
-translation binary -mode 19200,n,8,1 -blocking 1
```

and this instruction is the same for Windows and Linux.

Tcl/Tk is more mature and better suited for this
application. We used Tcl/Tk at Bell Labs 6 years
ago and it's still being used at Bell Labs today.

Someday, Python will "get there."
The drum beat is getting louder so it's just a matter of time.

Another advantage of Tcl/Tk is the Tcl-to-Tk interface is
smoother than the Python-to-Tkinter interface.
Tcl manipulates Tk variables directly.
Python can only handle Tkinter variables indirectly.

If I was writing non-gui software, or GUI software
only for a single OS, I'd probably use Python. Pure
Python is more powerful than Tcl.

(I like Perl and have written a lot of Perl code but Python is cleaner.
It's too easy to write cryptic code in Perl.)

At this point, Tcl/Tk is the best bet for writing GUI multiplatform
programs which do serial I/O.

As I understand it, the Electronics Commuications Privacy Act of 1986 (rammed thru congress by ultraliberal Sen. Patrick Leahy [D-VT] at the behest of the cellular telephone lobby) outlaws reception of cell phone traffic, as well as certain types of encrypted transmissions.
OTOH, The Supreme Court ruled that this ban does NOT apply to non-cellular cordless phones.
The cell lobby wanted ECPA as a cheaper alternative to going fully digital, and wanted to avoid having to put a sticker on their units saying that the cell phones weren't as secure as the sellers would like the buyers belieeve.

I too have joined the same Radio Club by Midland. I picked it up at Sam's here in Wilkes Barre, Pa for 39 dollars and change with the Fm radio feature as well. Just programmed it after I obtained the same codes for my county and adjacent county. So it picks up 2 weather stations. One In Allentown actually Mt Holly, New Jersey and Wilkes Barre which is actually Binghampton, New York. Trnasmitters are there only. I live between botht these sites and excellent audio. I just have to wait and see ift he same code works like it should. Thanks for the info here. It is what made me go to Sam;s and discard my old everything tone alert weather radio which works fine. nick

Actually, the NWS office located in Mt. Holly provides weather information, customized to a local area, to a number of NWS radio stations, including those in Philly, Allentown, and many in NJ. Thus, even though the information you hear on the Allentown station is prepared in Mt. Holly, it is specific to the Allentown and surrounding area.

Likewise, the information provided to the Wilkes Barre station by the NWS office in Binghamton is specific to the Wilkes Barre and surrounding area.

First i would get another 12v supply and try that (with same current rating)
I would test the regulator and see what comes OUT of it to the scanner
circuit and
check that the power diode isn't shot (which sounds like it is).

Gary.

I have found listings for various department stores, but haven't heard any (that I can positively indentify), even at two major malls. Is there generally a very limited range their frequencies, or what? Do they use specific code words that they might use? So far I have heard activity from my home quite a distance away from malls or dept. stores that sounds like dept. store security, but it could be for the general mall security instead. And even if I do know it's a Macy's, for example, how do I know which one in my city it is? Alot of the stores in malls these days are very similiar, (which would discourage iding by knowing the nearby stores) and I don't think that security guards would very often mention the specific mall or address they are at. I feel that I have probally heard a couple of department stores already but I don't know for sure.

You can go to RadioShack and get a pre-amp for the scanner. They will need
to special order it.

The base version is 940-0858 = $49.99
The handheld version is 940-0859 = $39.99

The difference is that the handheld version can go directly on the back of
the scanner and the antenna onto that, whereas the base version you'll need
another BNC wire to go from pre-amp to scanner (assuming it doesn't come
with one; not sure. ask RS people)

You'll need a 9v battery or 9v AC-DC adapter for either one (273-1767 =
$8.99)

BTW, i am not a RS salesman. I just have one of their catalogs. Very handy.

Gary; Thanks for reply. I did what you said and according to cheaper digital tester it says 18 volts coming out plugged in without connection to scanner. It is center pin positive. Would that be correct since it is rated at 14.8 volts on the transformer itself. Never measured it before.
Next. The regulator I believe was 6 or 8 coming out with the current voltage supply plugged in not sure without checking again. I do know the power regulator inside gets extremely hot fast like seconds to burn the skin. It even heats up the frame which would seem odd.

And next what does the power diode look like and where can or would it be located. Nothing looks charred or blackened or even melted which i though would be. I lloked at the filament in the tiny light and it seems ok. Like I said no display, light, squelch, sound or anything and all of a sudden.

I did notice that the backup batteries were left in and that acid had leaked out into the battery backup case which i cleaned out. Could this have contributed to the short when plugged in then not knowing it was left with batteries in and totally drianed and leaking. Nick

Source record: 48526

Some chains use common frequencies/tones for all of their stores.

For example, Target uses 155.625 and 155.955. PL tone is 179.9. The 155.625 frequency is commonly used for automated paging announcements ("Guest assistance to Toys", etc.) while 155.955 is the main frequency for comms between employees.

Old Navy also uses 155.955, but with a PL of 74.4.

Many Wal-Marts can be heard on 154.570 or 154.600. PL varies.

Fast food places also have common frequencies. Nearly all Taco Bells have an input of 151.895, PL 88.5. Output is 33.400, PL 82.5. Burger Kings commonly input on 154.515 or 154.540, PL 88.5. Output is the same 33.400, PL 82.5.

This should get you started. Have fun :-)

even if someone did break it,as soon as they mentioned it,there door would be knocked down,the Police in most cases have been tolerant of scanners but,if someone did break Tetra the implications would be serious and i do not believe anyone who managed to decode it and then tells people how its done would survive very long.

If all your doing is receiving, ya' don't need to be concerned about PL tones. Those are only used to activate a receiver whose audio is blocked unless it hears that subaudible tone. Your scanner/handheld (or whatever) will probably not be set up to block unwanted audio, so you'll hear whatever comes in on the received frequency, regardless of PL.

Why?
And legally what could be done to you if you were to break it,

I'd say you were more likely to have a friendy knock at the door from MI5 or someone wanting your skills at codebreaking (? well that's a bit far fetched but why not?)

Let's put it this way, "Bill" (if that is your name), it's in the form of an official FCC-issued amateur radio callsign. If it isn't one (and it isn't) then you are trying to deceive people by implying that you do have a amateur radio license. As for not caring what the law says, that's what most felons say. You'll probably be trading in your bogus callsign for another federally-issued number - Prisoner 75467895, or something like that, fairly soon. Most idiots tend to be self-eliminating, it's called Darwin's Law

Adios! <click>

No they wouldn't
Any sign of the encryption being broken they would simply add extra levels

Like when MS found the 40 bit encryption on IE 5.01 was inadequate
they brought out a 128 bit encryption update

Or you can have an extra level of encryption added to GSM phones for a few
hundred quid
So only another matching GSM phone can hear it

That's the advantage of digital systems

A new Target store opened this year near me (in IL)
and I can hear them use these frequencies:

461.0375 462.9125 469.4875 466.2875

The freqs are also listed in the FCC database
for this Target store.

The first freq is the most active with salesdroid
chatter, and a recorded announcement is often
broadcast summoning cashiers to the registers.

The last frequency sounds like it is used for unloading
trucks.

I had a similar problem on my Trident 100, any delay value of 0 or 1 will prohibit the scan of memory channels. In search mode it worked fine.

Try making the delay a higher value...let us know if it helped.

yes fair point on adding extra encryption,but still if anyone did try and market such a thing or even talk about it on any of the groups,that are watched by the authorities,it would not go down well.

Tetra of course will be added to any way as it goes along,so it will not stand still.

I do not believe anything really practical will ever be available to master TETRA,highest spec computers,plenty of memory and fast,it would not get me interested,a handheld that would be differant though.

I wish they had gone for APCO 25 without encryption,then we would be getting there.

At the end of the day,yes i will miss police and other 999 comms,but i listen to so much more.

Delay value? There is no way that I know of to change delay value in the PRO-2006. Bob Parnass wrote an article some time ago that I ran across today about Squelch Hysteresis. I have yet to be able to find R152 to try that fix. Even if it doesn't fix the scanning problem, it might fix the fact that the squelch is so tight, that when I squelch it out in an LIMIT search, it blocks out most close signals too. Yet, I may also reverse the mod of increasing channel scan speed to see if that helps. If all else fails, I have a full service manual on the way and hope that may shed some light on the subject.

Thanks for the help and suggestions.

Well Paypal has done it again to me.They are taking money from my account
for no reason as I don't use it since they screwed me out of $400.00.Now I
got a thing on my account saying they deducted from my account for update
charges.
I have emailed them several time with no results except for a automated
response to email them if I have a problem.So I do and get the same response
over and over again.
As of now I have closed my account and reopened a new one so they won't
screw me for more.
WATCH OUT FOR PAYPAL !! They will get you for sure.

Outgoing mail is certified Virus Free.
Checked by AVG anti-virus system (http://www.grisoft.com).

Source record: 48542

Does anybody know of a place where I could find explanations of what the
various categories mean when retrieving data from the fcc license database?
I get the important stuff, but I don't know the less self explanitory ones,
like:

COMM/Priv:
Auth:
Applicant:
Elig:
Antenna Sequence number:
Type First Use:
Class:
Type Entity:
Emissions:

I'm not asking someone to explain them all here, I'm wondering if there's a
page out there already that I've missed that would handle it.

Thanks for your help,
Ben

2975. FS MFJ 462-B multireader

Newsgroup: rec.radio.scanner

Thought I'd give you guys a crack at this before it hits ebay.
Heres a short excerpt of mfj's plug on it :

Ever wonder what those mysterious chirps, whistles, and buzzing sounds
are on the
shortwave bands?
Much of it is RTTY, ASCII, CW, and AMTOR
(FEC) signals passing commercial, military,
diplomatic, weather, aeronautical,
maritime, amateur and other traffic.
Tap into these "secret" signals
Plug this self-contained MFJ MultiReader
into your shortwave receiver's earphone jack.
Then watch these mysterious signals turn
into exciting text messages as they scroll
across an easy to read LCD display. No
computer, interface, special cables or other
equipment is needed.

Unit is in mint condition and hardly used - I's say a total of maybe 14
hours in 3 years.
They go for over $175.oo
(http://www.mfjenterprises.com/products.php?prodid=MFJ-462B)
I'm looking to get $85.00 shipping included.
Feel free to email me off list if your interested.

Regards..
Jesse

From the troubleshooting section of the service manual:

Symptom: Squelch operates but does not scan.

Causes/Remedy: 1) IC501 runninng "wild": Press RESTART Switch. 2)
Defective CPU circuit: Replace the defective components.

Hopefully step 1 will correct the problem.

Well your not alone. Do a google search on 'paypal screwing me" .
I recently signed up for their "services" and have one successful transaction to date but its probably a matter of time before I get screwed also.
When you consider its a free service and,at least in concept,very convinient,you have to wonder hmmm these guys must make money somehow.And that somehow is apparently by screwing people over.
It seems to me they are a scandal waiting to happen,and until a class action lawsuit is files it'll probably get worse before it gets ant better.

Good luck, mine is working ("beeping") fine today, We've had
numerous alerts in the DC-VA areas for thunderstorm warnings.

I noticed last night the LCD said "CHECK MANUAL" which is
displayed if the radio doesn't receive any SAME codes for a
190 hour period. I missed the weekly test last Wednesday
because I had my radio set to Sudlersville, Md. (WXK-97)
by mistake. Now it's fine.

Anyone can purchase the unit at www.scannerworld.com. No, I'm not a
salesman or affiliated with them. I am a repeat customer a state away.
Currently the WX-100 radio sells there for 54.99 plus 8.00 shipping.
Check it out it is still available there. Nick

Well, I just did a store search on their website
http://www.booksamillion.com/ncom/ebooks/
using Daytona Beach as a starting point and these were the closest two:

(Daytona Mall)
90 North Nova Road
Daytona, FL 32114
Phone: 904-255-5588
Distance: 1.34 miles from the center

2. Bookland - New Smyrna Beach (New Smyrna Regional Mall)
1944 State Road 44
New Smyrna Beach, FL 32168
Phone: 386-423-1678
Distance: 14.60 miles from the center

I don't see how scanning all 7 frequencies could work; the scanner would stop on the first one transmitting, whether weather alerting or not, and stay there.

I know nothing about the company, but Thunder Eagle advertises a "scanner" that will do what the original writer wants.

See

If you are looking for software for the ICOM IC-R75,
you can download my new tk75 software free from:

http://members.core.com/~parnass

It works on Windows, Linux (BSD, UNIX, etc.),
and perhaps MacOS X.

I don't warrant the software but it won't cost you
anything.

I am working on several new features for the next version.

Have fun.

Actually, it is ILLEGAL in many states (New York for one) to impose a
charge for credit card use (on the buyer that is), so the payee can
never be charged, at least in this State.

When you say "get one of those things to work" I'm guessing you mean to do what its supposed to do and decode,and not would the unit actually work when plugged in.
Yeah I've seen quite a few messages scroll on the lcd.CW especially was (is) a snap. I'm a confirmed gadget fiend, but I never got into the decoding like I thought I would-I barley have the time to just listen and scan anymore .
It works as advertised from what I've seen of it,but the baud rates and that were a bit perplexing to me and,as I said,I haven't had the time to learn.
Another thing that held me back was I don't know the difference of the various sounds,chirps,whistles and what is what,So I'd tune to an obvious data freq and go through all the various modes,baud rates ect trying to decode it-sometimes it would and sometimes it wouldn't. The times it wouldn't was probably because the unit isn't capable of decoding that particular mode-so someone who knows what the different modes sound like would probably find it alot easier to use.
If I dont get the price I want I'll take the time somewhere down the line to see if I can use it to its full potential - I know that whats his name klingenfuss guy has got a CD which covers the sounds various transmission modes make . And if I get into it probably get a more advanced unit as time and finances permit.

PayPal is a business,and if you allow them to verify your Bank
Account, you are asking for trouble. The competition for Paypal is
Billpoint, which is used mostly for eBay sales, but can be used very
much like PayPal, there is however a very large difference.
Billpoint is partially owned, and is operated by Wells Fargo Bank,
Legally it part of Wells Fargo Bank, which means it is subject to all
the rules, regulations and supervision of a Bank. PayPal is NOT a
bank, or are the subject to banking rules, regulations or supervision.

As for being free,it is free only if you don't use it much. if you do
it not only isn't free, it is downright expensive. The recipient of
the funds pays the bills, and they average about 4%.

One trick that I know of, that a friend of mine uses with two scanners, is to program in ascending order the set of frequencies for the system you are planning on monitoring, and another set of frequencies in descending order, and a third batch in random order. He has one set in one scanner as:

Scanner One:
Bank 1-Ascending
Bank 2-Descending
Bank 3-Random

Scanner Two:
Bank 1-Descending
Bank 2-Ascending
Bank 3-Random

Occaisionally he misses a few words here and there, but for the most part it works great for him. Short of buying a new trunk tracker, he uses this with two 800Mhz capable scanners he got realitively inexpensively, about the same price as a brand new trunk tracker.

True that. I had to sign up in a hurry to make good on an e-dept. Since then,I've read the TOS and,as one might expect,it has more loopholes than you can shake a stick at.
I still haven't seen a thing about those on the receiving end having to pay a fee - though if thats the case it must be somewhere in their FAQS .
I was under the impression that,besides scamming,they make their money by
1)Their 'premium'/business' accounts and
2)By drawing interest on the e-cash that people have floating on their paypal accounts.
But yes indeed people need to start reading before signing.

PayPal ISN'T free.. they take a percentage of all money that you
recieve in your account. Sending money is free however. Since the
money is transfered to another PayPal account, PayPal still gets their
money. I've had over 30 dealings with them and NEVER had a problem.
It's the best way to send and receive money for auction items in my
opinion.

Please explain a little further how they screwed you out of your money.
Was it really PayPal or was it the other person you were dealing with?
Or a combination of both? Did either one violate any laws?

Bill, W7TI

PayPal only look out for their best interests. The so-called "verified ID" only so that they can have a legitimate way to freeze your account and take money away from you without recourse. Try C2IT or BidPay. Much better way to go. - NA1A

I can't get PL tones to read on my scanner, a Bearcat which according to Grove Electronics, was no longer made as of 6 years ago. Still gets alot of neat stuff though, so I keep it around. As for wondering why one might want to hear dept. store freqs or other stores/informal business, well, you really can hear some neat stuff. At The Point (at Calexpo in Sacramento, where the State Fair is held) one of the employees was talking about how she could get someone free tickets and that she was a lesbian ... just as if this were a private phone call instead of official State Fair business use (The Point is owned by the California State Fair organization).
Unfortunately I have not heard from this lady again, maybe she got fired?

Dont know what to tell you - i have heard many complaints about them, yet i would assume there are hundreds of thousands - maybe millions of other people that never had a problem with them . I have never used them so i dont have to worry about it. How did they manage to screw you out of $400 actually - details would help - did they just decide one day to deduct $400 out of your bank account for apsolutely no reason at all - or did you buy something that you ended up getting ripped off from off of e-bay or something - and then wanted you money back ? If that was the case - i cant really put the blame on paypal. My guess is that most complaints about paypal are really just people getting ripped off at auctions - and expect paypal to re-imburse them as if its their fault. However if this is not the case and they for whatever reason felt they should deduct $400 out of your checking account for no reason at all , then i would be so pissed i would hire a lawyer - or at the very least file a complaint with the Better Business Bureau. Depending where you live - alot of local TV news stations also have "crack downs" on scams - tell them your story - maybe they can help. Either way if everyone that claims that they have got ripped off from them did their part to expose them - they would be out of business by now.

According to the BBB - it says
"Based on BBB files, this company responds to all complaints brought to its attention by the Bureau. PayPal meets regularly with the Bureau to evaluate complaints that have been received and to increase customer service satisfaction."

Better Business Bureau link to PayPal :

I've used them before, and did'nt have a
problem (yet). I'm not too crazy on the idea
they wanted my checking acct #, especially
after reading this post I never liked the
Idea of giving up my acct # and leaving it
open for questionable charges. By the way.
try going to www.badbusinessbureau.com
and check out their complaints on pay pal
and on the BBB. Yes, there are some complaints
about how worthless and biased the local BBB is.
Check out that website and see what you think...

Well, I have been using paypal for about 4 months now, and I haven't had any problems with them yet. As a matter of fact, someone somehow got my account info and pulled money from my paypal($53) and put it in his paypal, and I complained to paypal via email and phone. Within a week the money was reinstated to my account. The only problem I see with Paypal is that they do charge a healthy amount to the recipient for their services, but hey, it's a business, and nobody goes into business to LOSE money, right? I have made about 60 transactions on eBay, and I have used Paypal for about 50 of those, and I have never had a problem with them, besides the money that was stolen from me, and they corrected that very quickly. Their customer support people on the phone were very curteous and friendly.

If you idiots read all the post,you can see that I reopened another account at my bank so that Paypal cannot take anymore from me.I have check on my statements from my bank showing where they have taken money from my account and I DON'T USE PAYPAL FOR OVER A YEAR BECAUSE OF THEM RIPPING ME OFF.They will not stop a payment or even try to help you if you make a mistake on sending your money to someone.If you put down a wrong email address,that party can end up with your payment that was ment for another.I sent out exactly $396.50 for an item that was bought on the NG.The monies was not received by the party it was ment for.I asked to cancel the tranaction and was told by Paypal there is nothing they can do about it and they are not involved in disputes.Well this went on and on and till this day I have not got my money back and noone can or wants to persue it.It goes even more into it.

But they don't charge more for using a card: they give a discount for using cash.

The effect is the same, but apparently it gets them off the hook from the legal standpoint.

Instead of arguing among each other sit back and read what you wrote.

Then, take this complaint to the FBI Internet Fraud Division. You can
file your complaint on line.

I had a problem with paypal and ebay, my credit card company along with
the FBI cleaned things up
and my money was returned.

Name calling is childish.

Your legal recourse is to sue the person the money was actually sent to.
If PayPal followed your instructions, they are not responsible, IMO.

If you mailed an envelope of cash to someone and you mis-addressed the
envelope, does that make the Postal Service responsible? Of course not.
They were just following your instructions. Does the Postal Service
have an obligation to get your money back? Of course not. The mistake
was yours and yours alone. The Postal Service did not rip you off and
neither did PayPal.

It would be nice if PayPal could help you recover the money, but I don't
see any obligation to.

I don't know about any other cordless phones, but the AT&T 9100 phone I bought several years ago is totally digital spread spectrum from both the base and handset. I made sure to test it on both the transmit & receive freqs before using it. Listening in with a scanner gives you a slightly higher noise floor when the phone is in use. Impossible to make out any audio from the phone.

Tom

True. I know if I had subscribed to the Sprint newsgroup before i signed up with them I probably never would have signed up in the first place - as it stands I haven't had a problem with the service in over 2 years. Same with comcast,though I'm coming to the conclusion that they truly are a messed up outfit.
In this case,after seeing his explanation on how exactly he was screwed,I think there can be little doubt that it was his fault and that paypal has their butts well covered.
The person he mistakenly sent the money to must have had a paypal account I'm guessing,or else the transaction would have failed.
And the 1 transaction I had with them I know paypal sends a receipt of sorts that says the money was sent to so and so. At that point your relying on the good will of the recipient to follow through on the deal,as you would be if you sent a money order or whatever..
If your reading this N1,did you try to straighten this out directly with the person involved ?

I'm well aware that I'm not allowed to OPERATE a scanner on an airliner, but am I allowed to carry it on with me? Has anyone had any recent experiences? Will the the airport security give me a hard time? Thanks

From: Jester <jester72@optonline.net>
Message-ID: <3CE03F07.1EE3061E@optonline.net>
Source record: 48404

I've been out of the scanning game for a while, but am interested in getting back in to it with a new handheld. My current handheld (Bearcat 200XLT.. remember those?) just doesn't cut it any more.

I'd like to get some recommendations on which unit(s) I should look at. I did some preliminary searching around the net and found what appear to be some nice units from ICOM. Any thoughts? My basic requirements are clear audio, very good intermod filtering (I'll be using it in the Northern New Jersey area, where the Bearcat is basically useless) and a fairly compact size.

Please copy replies to my email at jester72@optonline.net.

Thanks..

You idiots are not getting the point.Ok I lost the money,but what gives Paypal the right to keep going into your account and take what is not theirs.I have not dealt with them in over a year.
As for you idiots that only read part of what is said,I have closed my account with MY BANK AND REOPENED A NEW ONE SO THAT i HAVE A NEW CARD AND ACCOUNT NUMBER.The reason is not to let PAYPAL take anymore from me.
CHECK OUT YOUR STATEMENTS IF YOU KNOW HOW! Maybe they got you to.
And for those who are emailing me saying it has happened to them also,POST IT HERE.That way all the retards that don't understand what they are saying before they read the rest and know what is going on.
I hope all of you don't get screwed from Paypal like I did.Don't forget one thing,I TOLD YOU SO!!!!!!

> Delay value? There is no way that I know of to change delay value in the
> PRO-2006.<

Sorry for the confusion...I was referring to the Trident trx 100xlt. It seemed he had tried everything, so I simply contributed a similar fix I, myself, had to figure out. Adjusting delay on the TRX made no sense to me either..but it worked. What can I say.?...I had to suss that out myself..I had no manual at the time and certainly no internet help.

Since I understood the user had a radio in good working condition, it was merely another shot before looking for other problems. I was very surprised when the delay value function impeded scanning. (But not searching. Like his problem too.)

Anyway, hope he gets it solved

I have never had a problem, although problems may exist. My Paypal debit
card says mastercard on it. Seems like mastercard's rules and regulations
might apply??
Also, when I receive money into my Paypal account a transfer it out.
That way they can't take it. This works for me so far.

I would recommend a Pro-94. I live in congested area and I have
no probs with intermod. It's got 1000 channes, and handles
both Motorola and EDACS very well. They also can run
off standard AA batteries.
I own two of them and hav never regretted the purchase of
them.

>

Actually PayPal is NOT downright expensive. I run several websites and use PayPal for my customers orders. I average about $30,000 per month in PayPal recipts. You are charged $.30 plus 2.2%. On a $20.00 purchase that would be a fee of $0.70 or only 3.5% which is pretty darn cheap. BILL POINT IS MORE EXPENSIVE! The same transaction on BillPoint would cost me $.85 in fees ($0.15 MORE) And there are many other services much like PayPal however they all change MORE! Example, CCNOW charges 9%!

If you want to "badmouth" PayPal that is your right, however when doing so at least get the varifiable facts straight! In an average month I save $225.00 in pure profit by using PayPal .vs. BillPoint.

I've been using PayPal for 2+ years, over $700,000 in total transactions and have yet to have a problem. However if you are a high volume PayPal user one smart piece of advice, clean out your PayPal account daily. I've heard of people having $1000's frozen which is totally stupid, if people doing that high volume would simply do a withdraw to their bank account one a day they wouldn't have that much money frozen.

Sorry but in the last two years I've had more problem with my "real" bank then with PayPal! That would be First Union.....

3049. Re: Department store freqs

Newsgroup: rec.radio.scanner
Date: 2002-05-14 02:05:35 UTC
From: Jim Mac Donald <jmacdon@mitre.org>
Message-ID: <3CE070EF.61495A07@mitre.org>
Source record: 48413

I use a RELM HS 200 that accepts both PL, CTCSS and Digital Private Line, DCS tones and also a ICOM IC R-2
that uses PL tones and CAN SEARCH for the active PL tones.
Tone coded squelch helps block computer related interference to radios, try walking through a store's check out counter line with a non tone squelch receiver or transceiver and the audio will LOCK UP on (if its a computer cash register, NOT a manual mechanical unit) point of sale terminal RFI! Tone also blocks pager inter mode and skip form ruining local traffic. If you walk around a location with a lot of computers and your scanner's bank(s) are all filled with
frequencies tagged with tone codes then liked a professional two-way radio equipped with tone code the radios
will be immune form inerfence form the computers! But all it take is one (1) Air Band frequency to lock up a scanner!
The great aspect of the Uniden BC 780 and Radio Shack / GRE's PRO-92 and PRO-2067 , like the R-2 is they have PL and DPL tone squelch and can search for the tones.
Many frequency directories have tone codes listed with the frequencies, this helps to set up the
RELM and Racing Electronics scanners and knowing the tone codes helps identify frequencies you have found
during a search. The station may not us their FCC call sign but if they use a tone code it will give a general idea of whose on the frequency .Lastly what tone codes are for is to separate the audio of different users sharing a frequency,
so the different radio operators or the tone capable scanner user won't have to listen to each other.
I listen to Mall security around New England most are on UHF and can be found at the FCC web site
and their tones can be found in Scanner Master's outstanding frequency directories.

>and only once did I ever hear
>anything of interest
.....
.....
I heard some neighborhood kid say he was going to "break into that little black car with all the antennaes."

Because he was sooooo stupid to be talking on his cordless and I was smart enough to monitor him, it saved me a lot of headache ie. police paper work.

I listened to this punk for over a year :take his orders" over the phone....example: "Hey what's up..can you get me a etc. etc."

And would read about it in my local "ploce beat"....I never said a word. But when I heard him talk about breaking into *MY* car....lol....he jig was up. ;-)

So there *can* be benefits to it, sure....more often than not it is boring, but it saved me some heartache and future victims he would have robbed.

Have you gotten any reply from them yet? I know that if they took $400 of MY money, I wouldn't just sit around and post about it on newsgroups. I'd do something about it. I haven't had any need to change account information any time recently, but I am sure there's a way to change what account money is taken from, or even to delete the account that they can take money from. Do that and I'm sure they'd suspend your PayPal account, but at least your account information would be off of PayPal.

Ok, I think I'm starting to get the picture on this...

This guy bought something from someone on the newsgroup. He entered the wrong email address when sending the money via PayPal and that's somehow PayPal's fault?

He says he hasn't used them for a year because they screwed him when it was his own fault, so why did he wait until now to tell us about it? Did they take more money out over the last year?

With PayPal, you can see the status of all money sent. It also shows if the money was claimed. If so, shouldn't it be simple to pursue this via legal channels?

What's the big deal? He screwed up. It's not PayPal's fault.

Yes, I'm hoping to get more frequencies like that. Bob Grove had reported once that he could hear fast food frequencies where the employees talked trash about the customers, apparently not thinking anyone was listening. I've had no luck with getting those, just the drive-thru freqs. I think that the lower the power of the radios/mics being used, and the less well paid the users of them are, the better the chance there is you will hear such silly chatter like I heard at The Point. I want to get more of this kind of stuff, it's lots of more fun than the cops usually are. The cops usually spew tons and tons of 'code this, code that', and even when they're speaking in plain English about horrible murders or what not, they talk with no emotion. And always without profanity (from them, anyway ... maybe in the background you might hear some) or an discourtesy. But then, they're professionals. It's more fun to hear people using the walkie-talkies or mics that aren't really sophisticated, well trained folk, like you often hear at stores or restaurants. But then I've also heard a tv annnouncer swearing between commercial breaks while out doing an event at Arco Arena, so there may be exceptions.

Im 13 years old and when I went through the metal detector they just
said 'do you have a walkie talkie or a scanner' and I said yes its
just a scanner. And they said alright and let me go through. Dont use
them in planes though.

Hi All,

I have seen 73 magazine at Waldonbook Stores here in PA. They only get one or two copies, so if someone buys them, they're out Keeping down on the number od copies, cuts down on the returns. Ask at the desk, and find out whne they get their new copies.

How many remember when Wayne moved brom Brooklyn to Peterboro.
If I remember, it had something to do with a divorce.

He wanted to keep W2NSD and the FCC wanted to change him to a W1 cakk sugb, That story line ran in 73 for quite a while. He obvously kept his W2NSD. It was a good mangazine then, although he never attracted any of the top writers.

He also had a running battle with QST and the ARRL for a long time. Of course this (by design) increased his circulation. There were quite a few ARRL haters in those days.

I haven't subscribed for years. I guess, when you live in Peterboro, you don't need mass circulation to stay afloat. Then, of course, he has his alternative medicine business. I got a copy of his catalog recently and he features his silver, among other things.

At this point, he must be close to 80.

Don

3074. tk75 v0.2 available, open source, multiplatform IC-R75 software

Newsgroup: rec.radio.scanner
Date: 2002-05-14 14:49:48 UTC
From: Bob_Parnass_AJ9S <parnass@megsinet.net>
Message-ID: <3ce12428$0$1408$272ea4a1@news.execpc.com>
Source record: 48440
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,alt.radio.scanner

tk75 version 0.2 is now available for free download.

tk75 is open source, multiplatform software for controlling
and cloning the ICOM IC-R75 tabletop receiver.

Changes include:
Limit Search and Auto Memory Write Search
Control of virtually every IC-R75 Set Mode setting, including
timers, RTTY settings, RF/Squelch knob, dimmer, etc.
Sync the radio's clock to the PC in local time or GMT
Comprehensive, easy to understand filter configuration
Improved CW pitch control.

I use the free and more stable Linux operating system
instead of Windows. But, I wrote tk75 in Tcl/Tk so it runs on
either operating system.

It will probably run on Windows ME, Windows 2000,
Windows XP, MacOS X, Solaris, FreeBSD, and other environments,
but I've only tested it on Linux and Windows 98.

You can read about and download a beta test version of tk75
from my home page:

http://members.core.com/~parnass

I don't warrant the software, but it won't cost you anything.

Thanks to Bob Grove for the loan of an ICOM IC-R75 receiver
so I could design and test tk75.

When 73 was in Brooklyn, they were doing it out of their own apartment.
The magazine was successful, and they needed more space. I can't remember
what Wayne wrote about picking Peterborough.

The divorce came some years later, 67 or 68. He later remarried, and
of course his ex-wife re-appeared in 1975 or so, for the launch of Byte.
And a few months later, the magazine was stolen out from under Wayne; I've
still never seen a full story of what happened. Though, apparently the
new magazine was in the name of his ex-wife (why her and not someone
else sure isn't clear), because Wayne was having tax problems and maybe
that spat with the phone company over the series of articles about the

phone system meant impending legal problems, so he didn't want Byte in his name.

I think 73 had some fine authors, like Jim Kyle, Jim Fisk (who later started Ham Radio magazine), and Hank Cross, W1OOP. I think each of the magazines tended to have their own circle of authors. I think 73 sometimes lacked a "seriousness", which worked both ways. You'd get interesting articles that weren't construction articles, and there was plenty of space for tidbit-style articles that filled the end of a column of an article. But even if they would run an artilce on weak signal detection, it did not get the respect it would if it ran in QST (or later Ham Radio). As a side note, sometime back I found a webpage from Jim Kyle, who wrote an awful lot in the early days of 73, but then disappeared. Apparently, he wasn't all that interested in ham radio, and when other markets opened up, he moved on. They were great articles, though.

73 was still pretty good in the seventies. But somewhere in the eighties it started going down hill. There was the period when Wayne sold his magazine empire (mostly all those computer magazines, but which included 73) so for a while he had no connection with it. Eventually, the company that bought the magazines didn't want 73, and it reverted to Wayne. But some years of his absence, and a fairly non-ham staff, lost readership, and it never recovered. Things kept changing, and the magazine kept slipping. There were too many errors, errors that indicated the proof-readers were lacking the basics, and the articles got less and less interesting. By that time, the authors who had been common to the magazine had either moved on or stopped writing.

Of course, by Wayne's own admition, he has been rich a number of times, and usually ended up losing the money. When he sold off the computer magazines in the early or mid-eighties, he got quite a bit for them 9even though all of them eventually faded out). I think that happened a second time, when he sold off a second slew of magazines, or maybe it was just his CD magazine and empire. The first sale sold off just about everything, including apparently some personal items. So it took some time to rebuild his ability to publish. But I suspect for years, he's had that ability, which probably gives him a lot of independence. And as long as he hasn't frittered his money away, he could still be in pretty good shape financially.

Wait. Something did happen in the early nineties, I think about his cold fusion magazine. I can't remember exactly, but I think he wrote that someone stole it, or it went bankrupt. There was rumour that 73 was going under at the time. It seemed though, that 73 was published from a different company, so it was safe. But this lead to the state of 73 today.

A few years back, as I already mentioned, they cut back dramatically on newsstand distribution. This was a time when it was really late, and skimpy looking. Newsstand distribution tends to lose money, so relying on subscriptions may be more profitable. On the other hand,

if the magazine isn't out in public view, who will know about it? I haven't seen it in three or four years, and while I once loved the magazine, it's hardly in my thoughts anymore. I just remembered that someone I know was recently in the US, and I'd given thought to things that might be brought back. Until just now, 73 hadn't even come to mind.

Wayne made Peterborough a publishing capital, because he moved 73 there about 40 years ago, and then kept launching all kinds of magazines that others eventually bought. Ham Radio must have set up nearby because Jim Fisk had been 73's editor. There must still be related companies in the vicinity, though I can't think of what magazines. Though, come to think of it, the last time I saw a copy of 73, I don't think they were still in Peterborough.

I agree with someone's comment that the magazine will die with Wayne's death, or inability to keep with it. It's an independent magazine, a rarity, and it is too much his magazine. I never had any of the animosity towards him that I've seen over the years, in fact always enjoyed his editorials, but with time there hasn't been anyone there to keep him in line. The junk-medicine stuff is a good example; it seems to have gone way beyond a passing reference.

Use 'em in the plane if you can. I've used ham radio, a scanner, and
a GPS from an airliner. The coverage and reception are very
interesting.

Read the airline magazine as soon as you sit down. See what portable
electronic devices are prohibited. I noticed that some airlines allow
GPS units to be used. It is "cool" to see how high you are and how
fast you are going. Hook it to a laptop (or use a GPS with a map) and
watch your trip!

It is my understanding that any radio device may be used under the
authority of the captain of the vessel. I used to have a "form
letter" with a copy of my ham license and my intentions. It had a
yes/no checkbox and place for the pilot's signature. I would have a
flight attendent send it up front and sometime's I'd get it back with
the yes box checked.

These days, it may not be a good idea to slip the captain a note.
They may get pretty nervous.

Use discretion!

Your understanding is wrong.

The FAA rule in question states that the OPERATOR of the aircraft may permit devices which have been tested with the specific type of aircraft. That's the airline, not the pilot.

The airline may, if it chooses, delegate that authority to the pilot, but does not have to.

Tom: The current issue of SmartMoney magazine has an article that rips Paypal, in effect saying some of the things that have been reported here. I know that Paypal has a lot of satisfied customers but where there is smoke there is fire and I believe a sufficient amount of smoke is being raised concerning Paypal that a person should exercise great caution in dealing with them.

I released tk75 v0.2 today and that was the first
announcement about v0.2 on Usenet.

You are confused because I wrote 4 other
free programs and announced each version of them
at various times.

That assumes PayPal will give you a merchant account. PayPal has
consistently declined to give me one, although I have one from
Billpoint, and as a result of Billpoint is a lot less expensive for
me.

It also take PayPal at least 2 days longer to get the funds in your
account. I pay Billpoint 1.75% plus 35cents (on transactions below
$15, I pay 35 cents period. For that, the funds are in my account at
the bank the following business day.

Have you ever been able to speak to a real human being at PayPal? I
haven't. Have you ever read how many if, ands and buts there are in
their chargeback protection scheme?

Have you ever tried to get them involved in a suspected fraud? By the
time they read the email, the perp's had the merchandise for two
weeks! Billpoint doesn't make it easy to call the, but if you'd like
Janet Crane's phone number (she runs Billpoint), I can give it to you.
It wasn't easy to find, but it is publicly available. Try that with
PayPal.

Thats funny, because of my volume PayPal forced me to go from a reg.
account to a merchant account about 2 years ago.

> Have you ever been able to speak to a real human being at PayPal?

Everytime I dial their toll free phone number. One time I did have to
wait 15 minutes on hold however the other times I've called I was
talking with a human in just a matter of minutes.

3097. Programming Trunks in the PRO-94

Newsgroup: rec.radio.scanner
Date: 2002-05-15 02:48:36 UTC
From: JohnL <xyz@hotmail.com>
Message-ID: <absi46$kngjt$1@ID-127914.news.dfncis.de>
Source record: 48312

Hi all,

I just picked up a PRO-94 (they are on sale right now). After reading through the manual, I programmed in 15 channels (1-15) that make up the local county trunk group here in Ocean County NJ. These freqs are in the 506-508 MHz range and the system is identified at maxpages.com/frequencies as being a Motorala II system, so I picked "E2 - UHF" as the trunking mode for the group. However, when I press "SCAN" and then "SRC", the scanner never begins trunking the group. It seems to be searching for the control channel forever. If I L/O the channel where I hear the data, I can scan the remaining 14 channels in conventional mode and I hear conversations. Anyone have any ideas as to what may be wrong here?

thanks!

Did you enter the Base Freq, Offset, and Step Size? These are required
for a UHF Mot trunked system.

Phone tower blocked
Lake view saved for Townshippers

SIDHARTHA BANERJEE
Montreal Gazette

Tuesday, May 14, 2002

There will be no cellular-phone tower in this Eastern Townships community.

And no one in the municipality of 681 people is happier than 78-year-old farmer and developer Fred Eichenberger, who spearheaded the campaign to stop it.

"I am happy now; I'm relieved that (the battle) is all behind me," Eichenberger said in an interview.

The town council decided last week to reject Rogers/AT&T's plan to erect a tower on land owned by Donald Badger, West Bolton's longtime mayor.

The town's six councillors voted unanimously against a zoning change that would have allowed a 90-metre-high cellular-phone tower to be erected on the property.

The structure would have blocked a spectacular view of Brome Lake and the Bromont ski hill enjoyed by Eichenberger and a neighbour.

"There was too much pressure from the public," Eichenberger said.

That pressure came in the form of a 110-signature petition submitted to the council in early April.

Council's Decision

Badger said he had no problems with the council's decision because, ultimately, it was council's to make.

But he said a second tower in West Bolton would help limit the number of dead zones and improve emergency response.

West Bolton is already home to a giant Bell Mobility tower, and if another company or Rogers/AT&T were to come to town council with another proposal, Badger said, the project would have to be evaluated.

"If another project was presented, it would have to be evaluated on its merits as this one presumably was. Hopefully, next time it won't be on my property and I will be able to take a more active role in the debate."

Now that I have picked up a new PRO 94, I am selling my PRO-2006. I'm asking $250. Includes radio, manual, and original antenna. I've installed a new keypad and replaced the bottom half of the case. Condition is very good. The rig has the two "diode mods" done for speed and coverage. Bright display (otherwise I would have replaced that, too!) I've posted some high quality photos so folks can get an idea of the condition for themselves. You can view them at http://www.njmc.com/john/pro2006. There is four photos, each is 800x600 and less than 90k in size, so even dialup users shouldn't have a problem viewing them.

If you have questions or wish to make an offer, please contact me at jlemay at njmc dot com.

thanks!

That was it! I hadn't read far enough in the manual. I got through the
basic trunking section, but not far enough to explain entering the base
and offset.

Wow, this trunking stuff is a lot of information to grasp. It's a lot more
involved than punching in a handful of frequencies like I've been doing
for the past 12+ years.

I have an old 46mhz cordless phone (Panasonic) and was just wondering if anyone has been able to make the base unit into a low power transmitter that would transit the audio from say, your scanner in the house out on 46mhz so it could be heard on a portable scanner outside your house. If it can be done please let me know,i might try to get this old cordless phone good for something.

Dan9125@aol.com Thanks!

That may be too much work. You are probably better off hitting the garage
sales that should start up next month and look for an old baby monitor to
do the same. Why not continue to use the old phone and provide some
entertainment to other scanner users in your area?

If your department has ever had two emergency vehicles pulled over for drag racing while going to a scene.
If you have those chrome, naked lady mud-flaps on your pumper.
If your firehouse has wheels.
If you've ever got back and found you've locked yourself out of the firehouse.
If fire training consists of everyone standing around a fire get'n drunk.
If you've ever let a person's house burn down because they wouldn't let you hunt deer on their land.
If your personal vehicle has more lights on it than your house has lights in it
If you've ever walked through a Christmas display and walked away with at least 3 new ideas for a light scheme for your truck.
If your rescue unit can smoke the tires.
If your department name is mispelled on your equipment, in stick-on lettering.
If the nurses and doctors turn out the lights and hide when you show up at the hospital to get your equipment.
If fire dispatch can't mention your name without laughing.
If the local news crew won't put your department on t.v. because you embarassed them last time.
If you've ever locked the keys in your trucks.
If you've ever reffered to a light bar as "really sexy."
If your defib consists of a marine battery, a pair of jumper cables, and a fish finder.
If you've ever taken a girl out on a date in a pumper.
If your pumper has been on fire more times than it's been to a fire.
If your pumper smokes more than the house fire you're at.
If you've ever been arrested for indecent exsposure at a house fire.
If you've ever called it quits on a house fire when the beer got hot.
If you've ever been late to a house fire because you had to stop and get the guy who fell off the truck.
If you've ever stopped enroute to pick up a good road kill.
If you hand out spit cans before each company meeting.
If you have a sign out front of your station that says, "WILL FIGHT FIRES FOR BEER."
If your fire equipment has chew stains down the sides of 'em.
If everyone on your department is related in some way or another.
If your last four fire department raffles were for a shotgun...and a member won it each time.
If you borrowed the department's quick dump tank so you could have a neighborhood pool party.
If your Hurst tool is on loan to the local body shop.

If your safety officer is the person who broke his arm at the last house fire.
If you use a hanging noose knot for all your rescue operations because it's real adjustable.
If you don't allow a person to join the department unless they own a pickup.
If your roster has a high percentage of members named BUBBA.
If your dispatcher is the guy with the biggest & loudest CB.

If you like to tinker, it shouldn't be too hard. The phone will have a transmitter section in it so broadcasting your scanner audio on 46 MHZ wouldn't be hard. The hard part is figuring out which wires to snip or parts to rearrange to get the phone to do it. Of course this varies from phone to phone.

A friend of mine modified an old cordless phone to operate as an extender for his ham 2 meter radio. He hooked up his 2m rig to the phone somehow, and can communicate on 2 meters while in the back yard or anywhere around the house. If he can do this, it should be child's play to modify an old phone to rebroadcast scanner audio.

An easier way, as previously mentioned, would be to buy a baby monitor. You won't even need to use a portable scanner to listen to the one in the house.

Tom

Why not make it easy on yourself and put a telescopic antenna on the base scanner, and plug it in on your deck outside.

Would that not work too. Without being so technical.

Besides, what's wrong with listening to the portable scanner you're carrying around outside anyways.

You sure can,and you can play some nifty pranks on baby monitors and
old phones. the range is about 49.500-50MHz for the handsets. Look
around this board it is absolutely flooded with cordless phone freqs.

Here's another good use for an old 46 mhz phone...

Make a call on it in a well populated area saying to the other party you've found a dumpster full of audio gear or something else of value. Be creative! Give the location and act like you want to keep it a secret. Now go watch the fun and laugh your ass off! Chances are it won't be long until a crowd of people show up digging around that dumpster. Tried and true. One time I did this and at least 10 people showed up searching around an old dumpsite well into the night.

Hello...

I've been away from my scanning hobby for many years (I guess getting married does that to ya!). Now I've been thinking of getting back into it. YET: I've just learned that my local Police (Nashua, NH) has gone digital.

Being away for many years I didn't even know this existed. Are there digital scanners? If so, would that even help: would they be scrambling their transmissions?

Should I just not get back into scanning?

Bummed.

3150. Re: voice scanning boring, next step?

Newsgroup: rec.radio.scanner
Date: 2002-05-16 21:24:32 UTC
From: Mac Rosevelt <rapture@calweb.com>
Message-ID: <3ce42339_2@news3.calweb.com>
Source record: 48217

Sometimes the State Fair police are quite interesting. I once listened to them and heard that some guy with a big knife was heading out to the midway area (at home), during the state fair. Another time, late at night, a few weeks before the state fair, they reported a woman sleeping in the livestock area. All kinds of wierd things can happen, but usually not much happens. If you ever go to Calexpo, try going during the state fair, where there is tons of activity, everything from performer mics,1 vendor mics, carnie mics, the state fair police, Waterworld security, and other stuff. I have a list of frequencies I've found used at Calexpo if anyone's interested. Mostly heard them at home until I started to bring my scanner with me a couple of years ago. I wasn't sure if the police would let people use them, but I've asked several of them there and they said it was perfectly ok, as it's totally legal. I've shown it in plain sight of them and they didn't pay the least bit attention. One actually told me a little bit about the frequencies they use, after I mentioned two I had been listening to for awhile (453.150 is one of them, a great frequency anyone in Sacramento should have, there's alot of activity on that one for the state fair police), saying it was an old county police freq. A Waterworld security guy also said it was probally ok to use them at their facility. The only trouble I've had was in the Midway area last year. One of the Ray Cammack (whose company runs the midway) security guys hassled me, accusing me of using it to listen to cell phones. I spent about ten or fifteen minutes explaining that it was technicall impossible with my particular scanner (which doesn't get 800 or 900 mhz), and that I was using it to find frequencies for the carnies, of which I did indeed hear on my scanner. I also told them about the knife incident which I had heard, as an example of how scanners could be a useful tool for them to be aware of what is going on. They should always have a scanner tuned to one of the state fair police frequencies at all times. They asked how much a scanner cost, like they had never heard of any, and were suprised to hear you could buy them at K-mart for under 100 dollars. After the head of their security had joined the conversation, they let me go, as, legally, there was nothing they could do, according to the state fair police officer whom I spoke with afterwords. He said he would tell the Cammack security about the fair's policy on scanners (which is very scanner-friendly). If this occurs again I will not patronize Ray Cammack events again, and unfortunately, they will be back this year.

to track a phone call is not allowed by the laws of amrerica and canda, uk and other countrys but to do so you have to program all phone freqs in and make it track the call like trunk tracking 900 but you will only hear calls there if you world like get a scanner that has 2.4 and down and hook up to a dish tv or big ten dish it will pick up phone calls from all over the would. goto the uk scanner sites for infromation on how to hear phone calls

I'm currently playing Live Audio from NASA's Shuttle Training aircraft as it does practice Shuttle approaches to shuttle runways 15 and 33 at the Kennedy Space Center.

Some of the comms appear to be scrambled and others in the clear. This is the first time I've ever head these comm being scrambled.

I don't know how long they'll be flying but last night they were up pretty late.

Go to http://www.MilAirComms.com for the live broadcast.

One PD going digital isn't the end of scanning! There's still tons of other things to listen to - other PD's, state police, ambulance, fire, etc... there are supposed to be digital scanners available starting October, but at quite a hefty price tag... People probably thought trunking was the end of scanning, but the scanners came out and now you can get a good base scanner for less than $200 that does all kinds of trunking!

I know you are looking for something to use your old phone for, but
the easiest solution may be just to buy a wireless speaker and plut it
into your scanner, then bring the speaker outside, although I am not
sure of the price range of such an item.

Otherwise, an old 49mhz cordless phone makes a nice paper weight or
door stop :)

As-new. Much-loved but little-used. I bought it several months ago, and have only fiddled with it but a couple of times. Would like to find it a nice home. Original box, manual.

$150 shipped.

3166. Re: International Space Station Frequencies

go
>on a spacewalk.Thanks.

ISS primarily uses the Tracking and Data Relay Satellite System (TDRSS) for operational communications (both voice and data). You won't be able to monitor these communications. However, there are VHF frequencies in use for spacewalks (EVAs), backup voice communications, and amateur radio contacts. The following links have the frequencies and some useful info:

http://grove-ent.com/nasa.html

http://www.monitoringtimes.com/html/mtsatfreqs.html

http://ariss.gsfc.nasa.gov/

regards,
Tim

I am going to Dayton on the 18th. I am going on a bus with the radio club. I can bring small items with me. Also I would like to raise some cash before Dayton so make an offer on anything on the list.

Please if you have questions or want to make a trade contact me off list at my e-mail address. gundoc@insightbb.com... Some of these lists are not swap lists and only tolerate my post because it is only once a week. To the group owners thank you for letting me continue to post to the group.
Dean

GE Portables

GE MPA VHF 146-162 full system keypad. Radio is as new and is almost perfect. The only flaw is the grip tape under the PTT button is peeling at the edges. Otherwise perfect. The next feature is, The radio is Key pad programmable. 16 channel scan and front face programmable. Has a like new battery and a good rapid charger. Also a belt clip. $500.00

GE MPA VHF Select 157 - 174 split. Nice radio 9 condition with battery and standard charger. I have it programmed down to 154 MHz with no trouble but will go no lower. $200.00

GE MPA UHF Scan 440 - 470 192 channel scan. Radio works great. A little paint wear on the edges but I have seen worse. With charger and battery. $225.00

GE MPD select model 470.- 488 MHz. 48 channel Alpha-Numeric display. With battery and standard charger. 7-7.5 $85.00

GE MPD scan VHF 150.8 174. 48 channel alphanumeric display. These look good and come with a battery and standard charger. 125.00 each.

MPD Voice Guard VHF system model with full keypad. 48 channel alpha display. With battery and standard charger. $135.00

GE PCS VHF 2 channel. Like new 9.5-10 condition. 150 -170 MHz. With battery, antenna, leather case, and pocket charger. $100.00 each. 2 available.

GE MPS VHF Like new 10 channel. With new battery, new antenna, and a standard charger. $65.00

GE MPS VHF 12 channel. Set of 4 that talk to each other with all new batteries and antennas. All in a rack charger. $225.00

GE Monogram UHF 10 channel portables. 3 radios 2 new batteries and 1 good battery. With 1 dual slot charger. $200.00 all 3 radios.

GE Monogram VHF 10 channel portable. 157-179 split. ex CSX radio. I sold this radio a year ago but have taken it on trade. Condition 8 with belt clip and charger. I had this radio run for stolen from CSX by a local CSX
Special Agent when I first bought these in a lot and was told that it had been sold at salvage. Perfect for a RR Museum or shortline on a budget. This could also be programmed for marine frequencies. Like new tall Battery. $100.00

GE Mobiles

GE Phoenix SX VHF 128 channel scan. With Mic, Has all 8 proms. $100.00

GE MLS UHF 8 channel. With Mic, power cord and hang up box. MLSU240 450. - 470 Looks good. $125.00

GE Mastr exec II VHF 75-watt mobile complete with accessories. $60.00 each

GE Mastr exec II VHF Mobile extender (repeater like Pac rt) for Mastr II or Delta. $20.00 each

GE Mastr exec II VHF Mobile extender for GE Ranger (only Exec II that I have seen marked Ericsson) $65.00

.GE S550 head 16 channel looks good but not tested. $35.00

GE Mobile Vehicle Adapter for MPA, MTL, MPD, and TPX. This unit charges your battery and turns your portable into a mobile radio. (Convert a Com)
With mic, speaker, and power cable. $100.00

GE Accessories

GE TQ 2310 suitcase programmer. Has PLS, Phoenix, Delta s/sx, Voice Guard, MPS, and Ranger. Printer is not working but I tried and it programs radios without the printer. Has manual for the programmer and the computer. Has Phoenix cable and Voice guard cable. All in the original GE case tested and working. (except printer) $850.00

Mastr II control cable. $8.00 each

Mastr II head for mobile repeater operation. $5.00

Mastr II Mic. $5.00

Mastr II 8 channel tone boards. $5.00

Mastr Exec II VHF receive section. $20.00

Mastr Exec II VHF Exciter. $18.00

Mobile Repeater cable for Mastr II. $10.00

Mobile Repeater cable for Delta or Ranger. $30.00. I have seen
programming cables made from these.

GE white Versatones, 103.5, 162.2, 173.8, 179.9, 186.2, and 203.5.
$4.00 each. I have a large amount of 203.5,186.2, 179.9, 173.8, and 162.2.
If you buy 10 = $3.00 each. Buy 15 =$2.50 each. Buy 50 = $1.50 each.

GE Mastr II Icoms. EC = $5.00 each, 5C = $10.00 each.

GE Delta cables. These are the downloading type used with the S820
heads.
And all other heads $40.00 each

Delta mounting plates. $10.00 each

Ranger mounting plate. $15.00

GE S-550 / 500 and others mounting brackets. $5.00 each

GE MPA, MPD, MTL standard Speaker mic. $25.00

GE PCS Universal charger. With wall transformer $20.00 each

GE MPA standard chargers. $20.00 each

GE MPA Rapid chargers. $30.00 each

GE MPI desk charger with wall transformer. $10.00

GE MPI Rack charger, 8 position. 25.00

GE MPI Mobile battery charger, Rare. $20.00

GE Battery discharge analyzer. For MPA, MPD batteries. Attaches to a
rapid rack charger with a DB 15 cable and uses a MPD body to attach a
battery to. Has LED readout in display area of MPD body to tell discharge
rate.
Another rare GE goodie. $45.00

GE shoulder strap like new, attaches where belt clip is. $15.00

GE Belt clips. $10.00 each

GE Voter. Has 9 total rec. cards and 2 TX cards. With extender card
and power supply / speaker. $300.00

Other Radios and Accessories

Motorola Saber III VHF 146-174 split. 120 channel Alpha-Numeric
display with secure - net module. (no out of country sales) des I think. I
have been using this all week and talking on the ham band to test this
radio.
Battery has lasted all week during drive time so it seems good. With rapid
charger and big battery. $500.00 or trade for a VHF MRK II

Icom 3200 a Dual band ham radio. Has box and manual but no mounting
bracket. Has tone squelch board installed. $200.00

Icom IC 24-at Dual band Portable. In good shape, Display has no scratches and only 1 small patch of the paint is peeled off of the back of this radio. With manual and wall charger. $165.00

Maxon 5050a Low band portable pair. Like new condition with 1 battery charger but I will split up the pair if someone wants 1 radio only. 6 channels programmed for 10 meter ham band on 2 repeater pair and 4 simplex frequencies. 2 radios and 1 charger $195.00

Marconi UHF portable. 16 channel scan with NOS battery. Made by Midland.
$75.00

Midland 70-336B VHF Mobile radio. 8 channel scan. with mic.$75.00

Motorola GP300 VHF 2 channel. on ham band. Has battery OK condition and charger I had to re-list due to a deadbeat buyer. $150.00

Motorola Mitrek VHF high 110 watt drawer only. $50.00

Motorola MT500 VHF nice shape. Crystals removed but I have 1 set of crystals for each radio. Also have a working battery and charger for each. I have 4 of these. $50.00 all

Uniden SMS 825 ts, 800 MHz Dash mount radio. $55.00

Voter from IMTS phone system. 2 rec. and 2 TX cards. $40.00

Maxon Rapid Rack charger for 0510/0520 radios. Think they will work with the sp2000 as well.$35.00

Consignment section

This area is for a few friends who like those other radios you know

"Motorola" They are good people and I will pass along any trades you may wish to make.

Motorola X9000 VHF 50 watt, Alpha-Numeric head, Siren complete.
$425.00

Motorola single rapid chargers for HT600, MT1000, P200. $25.00 each

Motorola HT1000 UHF Intrinsically safe, Re-cased looks new. 16 channel scan with charger. $425.00

Motorola P200 UHF high power. 6 channel. $150.00

EF Johnson Challenger UHF 80 watt trunk mount, 99 channel Alpha-Numeric head.$225.00

Want List not FS
Extra parts for suitcase programmers. Data modules, Printers, cables, proms, Anything you have extra. MPA or MPD portables what do you have and what do you want for them? Johnson scorpion program cable.

Terms
All prices are plus shipping from 40201. All items are used unless noted and only have a no DOA warranty if I say it works. If I say not tested your on your own. If I think it may be bad I will not list it. I take cash, Postal Money Orders, Paypal, and checks but I hold them for up to two weeks to clear before I ship. If you have a question E-mail me.

>> does anyone have the registration name and key for this program?

Yes, I do!

Would I share the key with you? NO!

The author of ARC780 has provided an excellent program at a very-reasonable price.

Do us all a favor ... drop your ISP. With the money you save, you, too, can acquire ARC780 legitimately in about a month.

Jeff Multer
Fort Mill, S.C.

Can anyone help?

I want to locate the discriminator chip in my Radio Shack Pro-74 scanner.

If someone tell me the chip type/number and possibly it's location in the receiver it would be great help.

Thanks in advance

Graham

Great,

Many thanks for your help. Have you done a mod to this particular model? I'm going to make an interface so that I can use trunker.

Thanks again

Graham

HEY yourself!

I was born a redneck and turned out to be smarter than everyone in the
county (its why I'm a hacker now).

Personally, I find these jokes amusing (half of them are true).

if you can't develope a thick skin and learn to laugh at the foibles of
your peers, then you really need to get a life!

I'm afraid he passed on a number of years ago (complications due to cancer). He was also in the middle of a court case when his health went south. it made for some livel discussion around here (and of course, there was always a small group of dissentors who hated him).

some of his books are still in publication. I think his wife takes care of most of the estate details these days.

Hi Guys
Finally my packaged arrived after 8 weeks and a few screw ups.
Ordered from Universal Radio in Ohio no problem.
Then Customs Canada values my package at over $900 and it was only $100 and
they wanted my to pay the tax on the $900 value so
I had to send it back so they could read the damn label right. sheeez
So it has been a long wait but its finally here Whats here?
Well, let me tell you
I finally got the RT systems software for the R2.So far so good.It seems ok
so far.I need to play with it some more to see if I like it
First impression is that it is sort of ordinary looking to me Not as good
layout as arc2 demo I d/l the other day{KeyGen anyone]:'}
My other purchase was a pair of antennas Firstly the Watson 881 Super
Gainer. And WOW What a big antenna I have teehee
No really its a great antenna it is Sorta looks Funny on top of my R2
and its top heavy, but man does it pull in the signals Its great The best
one I have tried yet I highly recommend it
The next one is a Comet SMA501 stubby and holycow it is small
It does ok for freqs over 100mhz and up Its very good to use in public where
its stealthness is great.
Well thanks for reading and please feel free to pass on any pointers
to me as i need them all.
Thanks,Rob

Message-ID: <3ce59142_1@news.cybertours.com>
Source record: 48255

Don,
This is funny.

Mark

Mrs. Davidson's dishwasher quit working so she called a repairman. Since she had to go to work the next day, she told him, "I'll leave the key under the mat. Fix the dishwasher, leave the bill on the counter, and I'll mail you the check.

By the way, don't worry about my Doberman. He won't bother you. But, whatever you do, do NOT under ANY circumstances talk to my parrot!"

When the repairman arrived at Mrs. Davidson's apartment the next day, he discovered the biggest and meanest looking Doberman he had ever seen. But just as she had said, the dog just lay there on the carpet, watching the repairman go about his business. However, the parrot drove him nuts the whole time with his incessant yelling, cursing, and name-calling.

Finally the repairman couldn't contain himself any longer and yelled, "Shut up, you stupid ugly bird!"

To which the parrot replied, "Get him, Spike!"

3190. BC895 vs. RS-2053

Newsgroup: rec.radio.scanner
Date: 2002-05-18 00:10:52 UTC
From: hc.me@ix.netcom.com
Message-ID: <3ce59844.45886053@enews.newsguy.com>
Source record: 48257

I'm looking to get my first scanner, and I've (kinda) narrowed my search down to these two for now.

I live in Waynesboro, VA (zip 22980), which is a semi-rural, hilly town just off the western side of the Blue Ridge Mountain. Trunking is not currently used around here,

So far, the BC895 ($194 at Grove) appears to be the better of the two. On the other hand, the Radio Shack 2053 is currently on sale ($179.), has a couple local dealers that seem to be fairly helpful, and may well be good enough for me in this particular area.

I would like to be able to hook whatever I get to the computer. I'm not sure quite why I want to do that, but it seems like it might be a help. Both scanners appear to offer that.

Any advice? Alternate suggestions?

Thanks!

Harry

>does anyone have the registration name and key for this program?

--- The original poster of the message above clarified his intent in an e-mail to me. Unfortunately, the e-mail I sent directly to him ... and apology ... was returned. I hope he receives this reply:

" My apologies for misunderstanding your intentions. I may have had too much coffee this morning.

Even with the expense, I think you'll find ARC780 worthwhile. The Butel (ww.butel.nl) site provides alot of information on the features. I purchased the registration through PayPal, and received the key in less than 12 hours.

There is a list on Yahoogroups.com called "ARC780-software" that is useful for any questions that might arise. The software author is an active participant in the list.

Again, my apologies for jumping to conclusions. "

> Radio Shack 2053

Does the 2053 have computer control??? If so what software works with it. The pc control feature is nice even for a casual listner like my self.

I purchased an 895 some time back (within last year) from Grove. I've slept a few times since but don't think I paid more than 150.00, seems like they had some kind of a special.

Vandalize it and then ask the repairman for the frequency. :-)

What does the antenna on the tower look like? How do you know it is
operational?

How far away is it from your location? No antenna might not be
enough to receive it. How many stations do you receive with full
squelch and an antenna?

Glenn

The 2053 is not computer controllable, only program and download into scanner from pc. With the right cable and software you can upload data for editing also.

Hi, I've just been hired as a public safety dispatcher for San Mateo County in California (I'm in the POST academy now) and was wondering if anyone knew any good websites where folks discuss the trade.

I don't really know whether either the Pro-2053 or the BC895 are
truly computer-contollable. I've Google'ed the heck out of both on
this newsgroup, and the information I've seen conflicts. I am
reasonably sure that both can be used with a computer for memory
management purposes -- which, by itself, seems like it would be a
big help.

For a seriously controllable scanner with lots of available
software, the Uniden BC780XLT (~ $350) seems to be the best way to
go at the moment. I just don't think I want to spend that much on
something that is essentially a new toy which I may or may not ever
use much. I suspect that if I do "get into it", I'll quickly regret
not getting a BC780. I'm also justifying not getting one because
there is apparently a "D" model (as in "Digital" upgrade for another
$350) on the horizon that looks to be even better than the XLT.

I have a bad habit of making everything too complicated. Can't seem
to change that...

> I purchased an 895 some time back (within last year) from Grove. I've slept a
> few times since but don't think I paid more than 150.00, seems like they had
> some kind of a special.

From what I've read about prices, you stole that sucker.

Regardless of price, there is also something about buying from Grove
that appeals to me. Bob Grove sounds like the sort of person I
would like to deal with. A guy who is *actually* interested.

As of this instant (ask me again in five seconds), I've decided to
take a shower, get dressed, take the dog to the park for a pee, and
then go buy a RS Pro-2053.

I realize Radio Shack has a mixed reputation here, but my experience
with them has been good. I won't say that it has been excellent,
but the people at the local stores have been helpful (working there
can't be the easiest or best-paying job in the world), and the
company seems to want to do a good job overall. Their return
privileges alone make that a decision I can live with. For $179,
complete with warranty and return privilege, I don't think I'll be
going too far wrong,

One nasty thing I'll say about RS is their website. Designing a website for a company that large and complex would not be easy for anyone. Still, they hired the wrong person for the task. Knowing as little as I do about the subjects of website design and electronics, I could do better. Give me a year and a couple hundred thousand bucks, and I'd make them a semi-decent website. Make it a couple million bucks and I'd have it done sooner than that.

In any event, I think I'll go take a shower now. After that, we'll see what happens.

Harry

I live in the United States and have a Radio Shack Pro-2053 Scanner. I have successfully trunked both Motorola Type I and II at the same time. However I am in a different area and am trying to program Type I with Fleet Maps. The problem I am having is that I have all the frequencies in the Type I bank and the correct Fleet Maps configured but the scanner won't stop on the transmissions. I can manually go through these channels and pick up transmissions along with the correct Fleet Map ID's showing on the bottom of the transmitting channels. When I go to scan the scanner won't stop on the transmissions even though I know that they are active during the scan of the bank. Any suggestions as to what the problem might be? Wrong Fleet Maps? Wrong Channels programmed? Need to program Offset? What would cause this? Any help would be appreciated.

Thanks,

Corey Fisher

I have been on this news group for years and I disagree that most people on this NG are in the US. I would like to see the US people keep the laws in that country to themselves or maybe use their freedom that they ram down everyone's neck to change the laws. You call yourselves free I don't think so.

Howdy - check your friendly local Radio Shack for the newest Polica Call
Plus - although it covers the entire Southeast (FL, GA, etc,), you'll find
specific info for your city. The vast array of info in the book is well
worth the price.

Go to the local Radio Shack and get the scanner guide for KY, IN, OH (I think, for some reason they don't include TN, as it's in another region.) The 10 Codes most rural departments use are the same as the State Police use. At least when I was on the local police department in Western KY we used all the same 10- Codes as the State PD.

Only program the data channels on the "MO" (Motorola) mode. DO NOT lock out the data channel(s). Operate trunked bank in 'open' mode for awhile and write down the user ID (in case you have the wrong ones).
I personally set all blocks to S-11 for my fleet maps. Also, make sure when scanning the sub ID talkgroup banks (where the user ID are stored) are all turned 'on'.

I went to the Downtown Plaza Mall a few days ago, and am fairly positive
that I have heard either the general mall security or the Mervyn's security
(somewhere) I listened at a couple of locations, with and without whip. I am
wondering if downtown the Mervyn's women's has a security team seperate from
the men's, and if the Mervyn's security there coordinates with the general
mall security (which is run by Pinkerton or Brinks security).

I have seend the disguised cellular tower as a (usually rather too tall and ugly) pine both on the east and west coast. There is one on the Mt. Vernon Parkway N of Mt. Vernon between the road and water in Virginia. I remember one on the west coast that I saw between the Golden Gate Bridge and Santa Rosa. Numerous ariticles have appeared about the church steeple use.

I don't know the frequencies, but I think the transmissions are digital (maybe someone else can verify this?), so you wouldn't be able to pick them up on your scanner anyway.

Correction--you could pick them up, but you couldn't decode the signal to understand what was being said without the proper equipment, which is generally unavailable to the consumer.

You're probably hearing Trunked Radio Systems (935-941) and paging (929-
932)

I highly doubt you'll be able to pick up wireless internet in the 900MHz
range as even the older technology uses 1.2GHz

Because when I said they could disguise them as Giant pine trees, I was being rediculous!
So, for you to just say they do, is menaingless, unless you can say where they are, so your claims can be established, otherwise its bunk.

Now the next poster narrowed it down to the East and West Coasts.

And given the fact that there maybe these fake pine tree towers, nobody has established that they are Cellular towers.

You are being called to PROVE IT, because it came out of your mouth, and you gave no supporting evidence, just hearsay.

But you'd convict a person on hearsay, like most clowns, wouldn't you? Ignoring hearsay, is just one of the ways a person gets a fair trial. And outside of court, in a discussion, hearsay is just a much junk as it is in court.

Obviously my Mom did a lot better job than your Mom!

It really wouldn't take long to find a source or two that would confirm what you said, and change it from hearsay to a fact.
But your Mom taught you to be a lazy fart...right!??? Well you brought my Mom into it, so take it! Well I will do your work for you!

http://www.uwex.edu/ces/cty/sheboygan/cnred/factsheet_celltowers.htm

Aesthetics
To satisfy concerns about tower appearance, wireless companies have disguised their towers as flagpoles, silos, artificial rocks, pine trees, palm trees and windmills. However, these design innovations cost the companies up to three times the typical tower construction cost, and they are most effective with shorter towers, which typically carry only one antenna. A town or municipality can decide whether it desires a few tall towers with multiple antennas - or many short, potentially disguised, towers with one antenna each.
Companies have also located antennas on stadium light poles, church steeples, and school and municipal buildings. The schools and local governments can earn $12,000 - $15,000 per antenna in lease payments annually.

[snip]

The 2053 does not have computer control - just the ability to upload
and download frequencies and setup. That's still very useful.

The freeware at pro93.com is not very good. It works, but it was kind
of a stopgap until better stuff became available.

There is an active PRO-93 discussion group at Yahoo! That's well
worth looking at for 93/2053 info - lots of very knowledgable folks.
There are also links to the good 93/2053 software (Don Starr's Win93
freeware) and interface cables at www.pro-92.com. (Note the "-",
which matters.)

I was thinking about getting either a Watson 889 tele-gainer or a 881 super-gainer. I listen mostly to 800Mhz motorola II trunking and use a pro-94 scanner. Which antenna would be better? Any other suggestions would be appreciated also. The antenna that comes with this scanner is not very good, I get a lot of static and crackles at 800 - 900 Mhz. I am hoping that a better antenna will help. Thanks.

You'll hear the morse code designator assigned to the particular navaid(NDB's only), and on some NDB's located at airports, they may also transmit the automated weather broadcast over the top of that as well. With NDB's, you verify the morse code when you tune it in to make sure you have the correct navaid.

Regards, Andrew.

Dayton was, as usual, outstanding.

The Hamvention was less well attended than those that used to occur at the end of April, but that is a _good_ thing - for us. I'm sure its not making as much money for DARA as those former Hamventions, but the lower attendance meant you could get close to things and see stuff. You could actually get to touch the radios in the big-3 manufacturer's booths without elbowing people or standing in a line for 15 minutes.

I saw maybe 60 % of the flea market by about noon on Friday. Then I came inside and stayed, since I was looking for stuff in there, and then it started raining so going outside would not have been productive - the vendors generally shut down during the rain except those with tents. It was a really cold rain, too, so unless you brought real good raingear and an array of cold weather clothing, you wouldn't have been comfortable.

On-site tickets were $22. Not too bad for 3 days, but much grumbling was heard about 3 things:

1) The programs don't come with the ticket any more - that essentially raises the price of the Hamvention to $27 unless you downloaded all the interesting forum info and vendor map info from the web site (not sure if the vendor map was available on the web).

2) The buses from the mall were $2 instead of free. Lotsa grumbling.

3) The private-owned parking across from the Hamvention went from $5 to $8 a day this year.

Other downers: The big tent at the corner of the flea market was replaced with several smaller tents. These smaller tents didn't have all that the big tent used to - Radio Shack, for instance.

A possible contributing reason for the lower participation - there was hype of extrordinary security measures - "no knives", "bomb sniffing dogs", etc. (I don't go places like that myself - too much hassle, as I routinely carry a pocket knife - and I think such measures are nonsense since many other things can be made into effective weapons) - but then remembered that stuff like that is _sold_ there, so such measures would be impossible - like "no guns" at a gun show... is a 1 1/4" combination wrench a weapon? Sure it is - and of course there was no such extensive security, although there were officers with dogs - they just were never seen sniffing anything. Probably ordinary K-9 units.

The common reason for less attendence that was heard was "ebay".

My take on that is that you aren't going to get a new radio that goes for $899 at the Milwaukee AES for $699 from AES on ebay like you can at the Hamvention. That was an example heard via "on the road" chatter as I was driving back to Virginia.

Conclusion: Dayton is still "The Big One" and is a more user-friendly Hamvention than ones of old that drew 37,000 people. Those were impossibly crowded.

Eric.....

I've been using a Watson 889 tele-gainer on my Bearcat 245xlt now for about a year. Very good performance on 800 mhz from what I can tell. I can monitor trunked systems a lot farther away, than I could with the stock duck. It also does a pretty nice job on VHF and UHF as well.

Chris

I did find proof, and it was too easy!
So, someone was very lazy, were they not?

Its not the reader's responsibility to substantiate what a writer states.
Or were you sleeping all through English class.

The other thing to keep in mind, the audience.
Sorry, but I am NOT a RADIOHEAD!
While it may be common knowledge for radioheads, it certainly is not for
those only subscribing to alt.toronto.

Its not obvious, either....unless you are a radiohead!

Therefore, I am from Missouri, you have to show me!
Of couse, if you don't....I will show myself.

As for proof, I posted one, of dozens of links that verify that Celular/PCS
phone companies build disguised towers, from rocks, to trees to Church
Steeples. I guess I should have posted the search engine results, rather
than one selected post, because there is already an asshole saying, if I
believe the source I quoted, then I am an idiot.

So I have been converted, and guess what, there is another asshole to step
into the spot I just vaccated!

Don't you just love USENET!!!

:)

View plane protection is an important part of property rights and is part of what zoning laws protect. Why is Mr. Eichenberger an asshole for protecting those rights and the value of his property? Keep in mind that to build this tower a CHANGE to existing law and land usage was requested and no acceptable compensation was offered to Mr. Eichenberger or the other affected neighbor.
One has to believe that there is another suitable site that would provide coverage for the area albeit perhaps not on the mayor's property. Also remember that the tower isn't being erected foremost as a safety device for swimmers but as a profit making asset for the wireless company. Their legitimate desire to expand their business does automatically take precedence over private landowners' rights.
Lastly, does it not seem somewhat odd that the proposed tower site just happened to be on the mayor's property? It sounds to me like the location was picked with engineering qualities taking second or third place to supposed "political expediency."

Lots of things.

Many VOR transmitters at large airports will transmit a voice
recording known as ATIS. This stands for Airport Traffic Information
System. It includes mundane information such as altimeter barometric
pressure setting, which approaches are in use, weather, and any
relevant notices such as taxiway closures or construction nearby. It
usually ends with a sequence letter so that when pilots call up the
approach controller they'll typically end with "...with India" meaning
they have heard the ATIS broadcast sequence India (or Victor, or
Uniform, ...)

Some VORs transmit continuous weather information for a region. These
are known as TWEB or HIWAS broadcasts. These broadcasts are useful
for updating any information that may have changed since the flight
plan was filed. For example, you could use this information to see if
the winds aloft forecast 200 miles away has changed.

Most VOR transmitters are monitored by a regional flight service
station (FSS). Often you can reach these flight service stations by
calling them on a designated frequency and monitoring the output of
the VOR. This split frequency usage is commonly used for relatively
local communications. Often you can hear pilots filing instrument
flight plans in the air, or updating their existing flight plans,
making a pilot weather report (for conditions such as ice, turbulence,
cloud tops and bases, etc.).

Finally, if your AM detector in your scanner is reasonably wide
banded, you'll hear a 9 kHz super carrier with phase information off
of magnetic north to compare the cardioid null from the signal to for
azimuth information from the VOR. If you know anything about how VOR
systems work, this might make some sense. If you don't know what a
VOR is, then this is gibberish.

For more details see http://www.faa.gov/ATpubs/AIM/index.htm
It's the pilot's bible on what all these navigation systems do and how
they work (or don't work).

Good Luck!

Interesting.

The guy who had the goat-cam last year traded his goat in for a rooster. Since our tailgate was adjacent to his, we got to make fun of it too.

I purchased one of the first of the new Kanga KK7B R2Pro kits. I'm well aware that although a couple of prototypes of this kit have been successfully built, I'm mostly a guinea pig... I plan to get started on it this week and I'll let y'all know what I think of it.

Fun stuff that lots of folks pointed at: a 25 watt Copper Vapor Laser. No I'd never heard of one before either. I don't have the slightest idea what it's good for except that it was very large and very heavy (large and heavy enough that even a full sized pickup couldn't get it home without a good sized trailer).

For those of you who want to own the ultimate surveillance receiver: AOR was showing their AOR-ONE. It covers 10 kHz to 3.3 GHz multi-mode in 1 Hz steps. They're asking for something like $4k for this beauty. No, it's not blocked for cellular. No, it's not for sale in the USA (wince), without authorization.

I got a kick out of Yaesu's display of the VX-5R --underwater and working! Personally, I'd have added a few goldfish to the tank just for fun...

Lots more to report. Those are just a few hints of the insanity.

73,

Jake Brodsky, AB3A mailto:frussle@erols.com

I also enjoyed Hamvention again this year (last year was my first), but....what I found most dissappointing was the apparent lack of interest in scanning/swl. The listener's forum on Sunday AM (not exactly the best schedule slot) had at most about 30 people attend. Out of all those thousands??? The Mobile HF forum, ATV forum, etc were packed.

Are we really such a small group of folks? Also disappointing was the very few used scanners, decoders, etc to be found out in the flea market. Yes, the deals and availability of new, current equipment were good, but where are all the killer deals on older equipment? Scanner Master, Radio Stop, Computer Int, and CAT were present as was Pop Comm. But where was Grove Enterprises, Ham Station, or any of the other great scanner dealers? I would think Monitoring Times could add to their subscription list and so could Scanning USA?

Is there no world class event for listeners?

RV (KD5LJK)

PS: Correction to some of the other posts - the underwater radios were the VX-7R - neat looking rig.

So, in a town of 681, a petition by 110 people blocked the tower.

How is that democratic, if the majority did not opposed the tower ?

I bet those radios weren't in the water. i remember a display for water resistant watches and saw the man pull them out of a dry tank behind the water. either way, they are supposedly water proof radios and my friend got one there for about 250.00,
I got several good deals, must have brought in 500 bucks worth of stuff for 300 bucks... The best two days I ever spent as far back as I can remember, except for when some idiot tried to lift my wallet...several radios were stolen and some vendors inside had their setup to where they couldnt watch there stuff well and I saw a couple of walk off's there... every crowd has them...

I want to buy a good scanner, that's for sure, and I've narrowed down my search to the BC780XLT from Uniden. At any rate, the question is whether I should spring for the UBC from Europe and allow for cell phone traffic. Will the scanner work in the US? Second question, why do so many people carry around two scanners. Is that really necesscary?

In many (most?) cases ATIS is not on VOR frequencies but on their own VHF frequency. Regarding another post, most (all?) NDB's in the US have ceased voice weather broadcasts.

I heard Yaesu equipment was selling at rediculously low prices,
(FT817 $499. FT100D $540?). Yaesu also showed off a new portable/base
radio, the FT897. Looked real nice.

Eric,

The Max 800 from Max Systems is about $30 and really good on the 900 MHz band. I have both the Watson 881 and the 889 and neither is a patch on this. However it is lousy on most of the other bands - not designed for it. By the way for the other bands the W-881 is a good choice - better than the W889. Radio Shacks $10 telescoping antenna is pretty good - in fact better than the W-881.

on around 450-460MHz I hear very acurate (repeated over and over)
signals I heard them all through the day and they never go away. Been
there since I got my scanner 3 months ago.I can turn squelch to the
max and it still is picked up, so its a signal. It's not microwaves, I
don't think it's paging because it's always on. Any ideas? Lots of
communications 450-499Mhz in my town but every 2MHz or so u hear one
of these digital beeping clicking staticy things. Just Wondering!

Dave

I love Dayton, and living in Cincinnati makes it real easy. I was disappointed. One, I'm getting real tired of the rain and cold. Weather was better when they held it a few weeks earlier at the very end of April.

Ticket prices are too high. No program anymore and increase in parking. No wonder attendance was down. Why charge for the program when the ads they sell are paying for the darn thing to be printed? Next year I wonder what manufacturer is going to pay to run an ad that most people won't see because they are going to fork out money to buy it!

I noticed that the Cincinnati Hamfest has reduced their ticket prices to get people to attend this coming year. They really screwed up moving it from its old location years ago. Used to be well attended. They kept moving it around town so it lost its identity. Nothing like it used to be. I hope the Hamvention folks don't screw up what they built.

Even with the bad weather, flea market prices are too high and the fools won't really negotiate down to reasonable prices for used gear. In some cases it's actually cheaper to buy new.

A lot of vendors that normally attend were missing or hiding real well. No Universal. No Jun's (Ham City) and a few others that usually attend were no where to be found.

The VX7R's were in water. The mics were actually connected and went right into the water so you could use the handhelds if you wanted. Oh, and R&L was selling them for $339.

One reason I think attendance is down is the lack of innovation in products. Much of the stuff is the same old thing with different packaging. I have to commend Yaesu for at least trying and every year they seem to have something new. Icom is talking about some new digital stuff, but I'm sure it is a ways off.

The Ten Tec Orion is nice, but the price is out of sight. Their new long awaited QRP rig started at $595, then went to $695 and now they are taking orders for an August delivery at $795! Too much money, not enough rig.

SGC used to have a good rig with the 2020, but I noticed they screwed that up and changed the fixed SO239 on the back of the rig to a pigtail. Another component to fail. Also they took away the power plug and now have a pigtail for the power lead. Yikes, on an HF rig?

APRS is really growing in popularity and there was a really nice APRS exhibit. People think it is only for tracking but there are a number of capabilities that make it very useful, fun and interesting.

Special note to the vendors. Try to look excited about your products when folks stop by to check out your products. I have a fortune in Kantronics gear so I stopped bu to chat. Early on Friday so they could not have been that tired yet...well I asked about intelligent tracking (APRS) for the KPC3+. Got a ho-hum answer that they're not going to do anything.

Hats off to the Yaesu gentleman (Japanese) that greated me when I went to get my free hat. I was carrying the FT-1500 box in my hand as I went through the line. He looked at the box and said "thank you very much" with a smile on his face. Now there is a man that made me feel good about buying his product.

One last gripe...get rid of the non-ham, non-computer vendors...are you guys that desperate for money? Just how many sunglass vendors do you need at a radio/electronics/computer show? And enough of the trinket vendors.

I just wish the Dayton folks and the vendors will sit down and talk about improving this event before is declines to the point where they can't get their audience back.

Of course many of the ills can be cured with more hams.

Back when they were legal to listen to, I found that cellphone conversations get excruciatingly boring after a short time. Unless you lived in a very small town, the chances of even knowing who you're listening to is so remote as to not even consider. And by the cellular nature, you'd only hear a few minutes of a conversation at most. Not only that, but more and more cell systems are going digital anyway. I personally wouldn't invest an extra cent in a scanner merely because it gets cellular. But to each his own.

Both models should work in the U.S., AFAIK.

There can be a number of reasons for using two scanners. There may be a particular service or agency or company that you want to monitor continuously... like the local fire department, trains, the company you work for, whatever. And you may then use a second scanner to scan the rest of the stuff that's of interest to you.

Also, some folks will dedicate one scanner and its antenna to a specific band... VHF-low band is a good example. Those frequencies (generally 30-50 MHZ) really cry out for an antenna that's long enough to be close to optimal:. several feet long (2808 / freq in Mhz = antenna length in inches for a quarterwave antenna.

A VHF high band antenna is generally quite satisfactory for VHF-high UHF and even 800 Mhz, so the second scanner might be used for those frequencies.

I'm sure others will come up with other examples. But unless there's something you just can't bear to miss - most scanners DO have "priority" channels for those important ones - one scanner is usually sufficient.

YMMV

remember though, the upcoming Unidens will only decode APCO P25 digital signals... most digital stuff other than public safety - and possibly the railroads, I understand - will NOT be able to be monitored by the Unidens.

Systems that are already up and running in other digital modes are highly unlikely to rebuild all their equipment to P25, nor would it generally be of any benefit to them to do so

Excuse me, but I suggested a Cell Tower designed as a "Joke"!!!
The response to my rediculous statement, was there are some, because I say so.

Of course I need proof! I was throwong out the rediculous, and someone says, but they have them, I have seen them.
That, buddy is hearsay! It is not proof, and from my standpoint, it was PULLING MY LEG!

As it turns out, my idea was not that rediculous, was it? Turns out that in fact Cell Towers are designed to look line Pine Trees, and other things as well. Yet, I am being valid, you are being dense. Opinion, hearsay DOES NOT establish a statement as a fact, and you have to know that! This is why I say YOU are being DENSE! The next guy, added some credence when he said, I have seen them too, and gave some areas where he saw them. But still, nobody gave any evidene to support their claims, the one I had made on my own - to be rediculous!

So I had to find proof myself, which I did.
Subsequently, a sharp person posted links to pictures of actual Cell Towers.

Secondly, I am mad at noone!
I am just not at all impressed, especially by a juvenille response, from someone who has been through school, and should know how to present their thoughts and ideas in some structured manner!

And if I was 14, as you think, then don't you feel stupid for talking down to a child smarter than you, as he dominates your simple mind in USENET? Obviously you don't even think before you fire off that big mouth. But I never accused you of thinking....did I?

Well, if you have a problem with me, have a talk with my parents!
An Utter...isn't that a TIT? Or mor accurately one big tit with multiple nipples.....thought so!
Not bad for a 14 yr old, eh?

No it is not. From the online American Heritage Dictionary, it's a
transitive verb:

1. To send forth with the voice: uttered a cry.
2. To articulate (words); pronounce or speak. See synonyms at vent1.
3. Law To put (counterfeit money, for example) into circulation.
4. To publish (a book, for example).
5. Obsolete To sell or deliver (merchandise) in trading.

I have a little Ramsey kit FM receiver that has an SCA output. I connect the SCA jack to the antenna input jack on my R75 and tune down to 92 kHz. The local college station has a reading service for the blind, which is pretty interesting to listen to when you're doing other stuff. None of the other stations around here have any SCA that I've found. I think a couple years ago there was a muzak service on one, but I can't find anything now.

for me to build?? I live quite high up. Im not very technical, so I would
need a GOOD plan/explanation of the design...

It depends on how far away from the police radio tower you are. I think a simple ground plane antenna would work. A ground plane is an antenna that consists of a vertical element, and then three or four horizontal radial elements, pointing 45 degrees down. For that frequency range you'd need to make the elements about 3 feet long. The vertical element would be connnected to the center of the coax, the radials to the shield braid.

Oooops...it was pointed out to me that I confused "utter" crap with a cows "udder", again!
I appologize for any misunderstanding caused by my "udder" utterence, any possible confusion created thereby, and for any offense it may have caused cows of either the bovine or primate distinctions!

Ken Roberts wrote:

>Wrong. You're thinking of an udder, not Utter.

>Ken

But Ken, I was actually thinking of "Utter". when the definition of an "Udder" played this harmonym trick on my mind.
Something like thinking of Real, and having the definition of reel pop out.
Well okay, maybe its more like Veal and Vale.
But I was trying to act like the 14 year old Utter wants me to be, so that would include making fun of his stupid name...right?
I am sure he got a lot worse when he was a kid. I mean it is a real tease me name! Not as bad as a guy named Cox! But you know!

And you know he will feel much better when he has evidence that his conclusions are not Utter Crap.
I am just helping him out by re-inforcing his pre-judices, and solidifying his sense of self, so he does not even question himself, for a second. Who am I to stand in the way of a self fulfilling prophecy?

So I will be 14. Perhaps in more ways than he wanted! But he asked. He asked me to respond to him as a 14 year old. So I did!
And that includes teasing when you have a stupid name!

Yup. Im a pilot for american airlines and VORS are never ATIS nemore.
Mainly due to problems between two things on one freq. NDBs, are
easily picked up, even on an AM radio. They broadcast their morse
ident signal. The signal ident is usually on a different frequency
that the actual aircraft instrument information frequency (which is
static). Hope this helps

Hi all,

Sorry for the crosspost, but thought both groups would be interested. I have the following books "up for grabs" if anyone is interested. All I ask is postage - probably no more than a buck or two a book to anywhere in the US.

Police Call

'95 Volume 1 CT ME MA NH NY RI VT
'96 Volume 2 DE MD NJ PA
'98 Volume 2 "Police Call Plus"
'99 Volume 2
'01 Volume 2
Beyond Police Call Volume 1 (all of US, only issued in '97 or '98 I believe, then became part of "Police Call Plus" and now is part of "Police Call")

All Police Call books earlier than '99 are Radio Shack "branded" (they say "Radio Shack" above "Police Call" instead of "Gene Hughs'" like in the ones you could buy elsewhere). '99 and later are all Gene Hughs' branded. Guess RS stopped rebranding them in '99.

Passport

1995 Passport to World Band Radio

WRTH

1998 WRTH
1996 WRTH

All books are in very good condition with intact pages and covers. All have been kept in a drawer and only used occasionally when I reprogrammed scanners or looked up a SW freq I couldn't find in MT. I'd say "like new" probably applies.

If you are interested in any or all, please email me. My *REAL* email address is "jlemay at njmc dot com".

thanks!

For experimental purposes only, of course...

Hi all,
I'm fairly new to the scanning hobby. As of right now, I only have a Radio Shack handheld. It's the Pro-93. My buddy and I were experimenting with his cordless phone and the related frequencies. He picked up the phone to call another friend of ours who knew what we were doing, and my scanner locked in on his frequency. It was in the 903 frequency. Oddly, I could not pick up his phone anywhere in the 925-928 range... only the 903 frequency, and I only heard his side of the conversation at that. He has a Uniden cordless phone. I walked down the street in every direction, and his signal was good for about four houses (or 200') in every direction.

Now, we are wondering about the indoor scanners that many of you talk about. My buddy lives *exactly* five miles from my house. We have a pretty clear line of sight in between our houses (not sure if that even matters...). Is there an indoor scanner that will pick up his Uniden at a range of five miles, if I was to enter the exact frequency that his phone shows up on? His phone repeats the same, exact frequency every single time. I assume that I would need a big-ass antenna on my roof or backyard? I know nothing about the indoor scanners. If someone could point me to a URL that may be helpful, it would be much appreciated!

Thanks,
Kenny

David,

I have a complete Icom IC-T81A package For Sale. Asking $350.00 for the

following items (AES pricing shown below):

IC-T81A 6m/2m/440/1.2 Quad Band HT $279.99
BC-119 Desk Fast Charger $99.99
AD-87 Adapter for BC-119 $8.99
Extra BP-200 NiMH Battery $85.99
BP-197 "AA" Battery Case $24.99
LC-148 Soft Carry Case $24.99
CP-13 Cig. Lighter Cable with Filter $36.99
OPC-478 $45.99
CS-T81 $19.99
AES Catalog Pricing Total $627.91

The Icom IC-T81A is in very good condition and works fine. It is an earlier version with the wideband receive. The MARS wideband TX modification has been performed. I have the original boxes. The selling price of $350.00 includes shipping costs within the continental United States.

Please email me direct if you are interested. My email address is: rbird2@peoplepc.com

Thank you,

Rodger

I think what you are trying to say is the following: Some NDB idnts (in the US) are simple 1020 Hz modulation which mean they look like a cw signal at =/- 1020 Hz (or 1.020 kHz) from the carrier frequency. To avoid interference, others only have the ident on one sideband which in some lists causes their freq to be listed with a 0.510 kHz decimal (being the center between the carrier freq and the modulated 1.020 kHz on on sideband).

Disagree. Been going since early 70's. I got rained on a _lot_, and
it was almost never a warm rain.

>Ticket prices are too high.

Try going to Kings Island if you think this is high, and the
Hamvention is better.

>No program anymore and increase in parking. No
>wonder attendance was down. Why charge for the program when the ads they
>sell are paying for the darn thing to be printed?

I noticed a lot _less_ ads in it. Mfgr attendance was somewhat less,
too, so there were fewer of those to place the ads. CATS, the guy
that repairs the rotators wasn't there. The guys from Indy selling
software weren't there, either. The big Radio Shack salespoint in the
big tent in the flea market wasn't there, and neither was the tent.

>Next year I wonder what
>manufacturer is going to pay to run an ad that most people won't see because
>they are going to fork out money to buy it!

Fewer. Charging for the program _is_ a mistake, I think, but not a
deterrence to me. Heck, I drove 1100 miles round trip for this - an
extra $5 doesn't even show on my radar screen.

>I noticed that the Cincinnati Hamfest has reduced their ticket prices to get
>people to attend this coming year. They really screwed up moving it from
>its old location years ago. Used to be well attended. They kept moving it
>around town so it lost its identity. Nothing like it used to be. I hope
>the Hamvention folks don't screw up what they built.

Ebay is said to be screwing up the Hamvention the most, and probably
the Cincinnati event as well.

>Even with the bad weather, flea market prices are too high and the fools
>won't really negotiate down to reasonable prices for used gear.

I saw a real nice roller inductor go for $20, after the guy had wanted
$30. I got an LS-120 superdisk drive for my computer for $35 in the
flea market. 6 split nuts to hook up ground wire for $0.25 a pair -
try to find those at Lowes or Home Depot for that price - forget it.
Flea market is OK by me. You may have run into a few people with gold
fever...

>In some
>cases it's actually cheaper to buy new.

People pay over retail on ebay all the time. Go figger.

>A lot of vendors that normally attend were missing or hiding real well.

Yep.

>No
>Universal.

Universal was there - the store and the tower manufacturer - store had
really small booth tho.

>No Jun's (Ham City) and a few others that usually attend were no
>where to be found.

I think the attendance was probably less than 20,000. You need more
than that to draw the smaller players.

>One reason I think attendance is down is the lack of innovation in products.

I like the new TS-2000 Kenwood - I have one out in the Jeep right
now...

>APRS is really growing in popularity and there was a really nice APRS
>exhibit. People think it is only for tracking but there are a number of
>capabilities that make it very useful, fun and interesting.

Yes, even I noticed APRS this time. First time I found out that you
don't need a computer in the car to use it. Any explanation of APRS
you read starts out with mapping software, etc. which leads one to
believe you need a computer in the car. For that reason, I wasn't
interested. Now, however, I'm thinking my old HT would make a good
APRS xcvr. Just wonder how I can carry on a regular 2 m QSO with that
thing also blatting in the near vicinity. Duplexer?

I think I would have liked such an experience too.

>One last gripe...get rid of the non-ham, non-computer vendors...are you guys
>that desperate for money? Just how many sunglass vendors do you need at a
>radio/electronics/computer show? And enough of the trinket vendors.

Well, I'll take _any_ income to the Hamvention that supports it. We could lose it, ya know! Hara Arena can't be cheap to rent. The flea market _wasn't_ sold out from what I could see, and the inside had space too. If you didn't have the sunglasses bunch there, then you'd have bare pavement not contributing anything, and the ticket price to get in would likely go up some more.

>I just wish the Dayton folks and the vendors will sit down and talk about
>improving this event before is declines to the point where they can't get
>their audience back.

I can't see anything they've done that could be construed as a fault. I believe that all the higher prices are likely necessary to keep the show going at all. I think that they should maybe have tacked on $2 or so to the ticket price and gave a free program with it instead of what they did - that would have eliminated the loud and obnoxious, in 1 case at least, people selling the programs, as well as the unlikelyhood that those sellers were doing it for free. They probably got $1 or so out of each one.

>Of course many of the ills can be cured with more hams.

Seven of 3--

Actually, confirming sources would not change the statement from
"hearsay" to "fact." The statement would remain hearsay, as would any
articles saying the same thing, no matter how reputable the source. It
might also be factual.

An assertion is or is not factual, irrespective of the quality of the
evidence. The question is whether the evidence is convincing. But even
convincing evidence can lead one to believe an untruth, and an assertion can
be factual, even if disbelieved.

Maybe the way around it is to have some e-bay auctions on site. Bidders could view the stuff, then run back to their laptops (or nearby computer kiosks) and put in a bid. The auctions could run 2 to 48 hours.

Laugh about it, but time will come when you will get outbid by somebody using a PDA and Bluetooth standing right behind you. The dealers would love it.

>Is there an
>indoor scanner that will pick up his Uniden at a range of five miles,

Kenny,
I kind of doubt it. I might be wrong in saying this......I don't think so,
but I might.

The scanner itself won't be near as important in you trying to capture his
signal as the antennae setup and actually at that distance, maybe the weather
also.

But that is a pretty good distance but maybe at the 900 mhz you might be able
to pull it off, but I can't picture it.

Just my take on it. ;-)

I've answered this before - maybe it didn't get through - 461.650 for the
big busses and 463.400 for the small busses. OK?

Do you mean the Gray or Red pagers that the Fire Dept uses about the size of a pack of cigarettes? The minitor pagers are available, plenty of the older ones (minitor I) available on EBay for about $10-$15. They have to be be recrystaled for the frequency you want, finding somebody to do it can be a hassle. I had G&G Communications work on a few a long time ago, great service just very slow due to them being so busy.

Dave L wrote:

We know that the new scanner that is comming out by uniden will be able to recieve the Apco 25 digital. Whats been going through my head is that the thing can actually recieve any kind of digital with the CORRECT program card in it. Right now after you buy the scanner, you have to buy the APCO digital card for another 300 some odd dollars. What a marketing deal for uniden. Come out with other cards for other digital systems in the future??? That way they dont have to come out with another scanner, just more digital program cards.

Just my two cents worth!!!!!!!!!!

I'd never buy radio gear on E-Bay.
All E-Bay represents is a "feeding frenzie"
type market for ham gear. What I see people
paying for ham gear on E-Bay leads me to
belive that there's an awful lot "shill bidding"
going on. Something that I would not put past
some of the so-called "private dealers" that
I used to see travelling to all the hamfests
like gypsy traders. You know, the guys that
buy up all the honest bargans offered for new
hams by the old-timers, that show up an hour
later on their table or on E-Bay for double the
price or more. Buy used ham radio equipment
on E-Bay...?? Anyone who does so should have
their head examined.

Yes I hope they are. I went up to the DARA booth and asked where the booth was for the scooters and they told me they didn't know. Didn't they put the show together? Then when you asked anybody else they tried to sell you a program for $5. Very Sad. I hope they learned something this year. Maybe the big companies should find a new place to have the ham fest. Somewhere that it will be about getting hams together to buy and sell radios, and share ideas and not about how much money they can make putting on the fest. To bad it has become only a money making project for them.
Atleast people like Icom and Yeasu were having some good sells. I too was getting tired of people saying I can get more then that on Ebay. Maybe those sellers should stay home and hide behind their computers because I'm not going to pay Ebays high prices.

Sorry just my 2 cents worth

But maybe I could get 3 cents on Ebay!!! HA HA HA HA

Never ceases to amaze me how cheap some hams are. Who gives a rodents behind about a program? Besides if you paid to get there and got a room what's a few more bucks for a program. I wonder how many get tossed or end up on the ground when they were free? Its called capitalism, and maybe with more and more gray hair in amateur radio, DARA had to do something to recoup their losses. I noticed the crowds to be WAY DOWN. AES had great deals, I bought two VX-1R's, they were $99 each!!! Just hope that we have bands to use all this gear on in a few more years. I have been to Dayton several times, and don't worry about the weather either. Be smart and bring the right clothes. Obviously there were several gonads who walked around with shorts on and tee shirts, probablly in the hospital now. They looked real cool!!! Didn't see the chicken cam, but did see the goofball with the tower on his head!! Always fun to people watch, can't wait to bring my newly licensed wife, she will be laughing all weekend next year!! Still the best hobby on earth...

Yes it can be done I put in 1100 mah batteries in mine ayear or so
ago.

They work great. Need bit larger charger or more time charging from
stock charger.

Make your own its cheaper. To buy from Radio shack you can get
batteries seperate for the same money but will be twice the capacity

This was my 1st hamvention and I had a blast! I've heard that attendance is down this year, but I think there was just enough people... enough to talk to, buy from, work on the air, etc. but enough that it's not a gigantic mob of screaming operators. :) I liked the Yaesu VX-7 display even though I only half-believed that they were actually submersed. They WERE actual radios though, I believe they were on weather frequencies. It was great to be able to actually use the radios on display, I've heard that at previous 'fests, you had to wait to use them. I got to sit and look at / use the PROII (I think that's what it was) for about two minutes! :) I didn't buy a program though, it looked like it was mainly sold as a souvinir (did I spell that right??). The crystal scanner, three business band HTs (one convertable to 2m), and two FRS radios are souvinirs enough. :) Plus, forum lists and maps of the arena (which were actually MORE ACCURATE than the ones in the programs) were available for free to those who asked nicely. There were a few good scanner dealers there. I stopped at Bearcat Radio Club and another scanner mag (which one?). Bob Grove planned to be there but had a family emergency :(Too bad, because I was looking forward to listening to him at the Teachers forum. One thing I noticed was that there's a LONG hallway that goes around all the arenas. Very handy once I found out about it. Also, did anyone else see the 25kw dummy load out in the flea market? Wow.. that's one big dummy load.

The moved it to May to try and avoid the "april chill" effect
but sometimes mother nature has a way of tossing a curve
ball into the jet stream :) That same weekend
there were record low temp's all across the Midwest
and Northeast. A fluke in the Wx that couldn't be
helped. (unless of course whomever else is reading
happens to be a "true believer" in the chem-trails
and weather modifications BullShip they promote
on reactionary shortwave radio, in that case I'll
leave the reasons up to their imaginations :) :) :)

> Ticket prices are too high. No program anymore
> and increase in parking. No wonder attendance was down.

> sell are paying for the darn thing to be printed? Next year I wonder what
> manufacturer is going to pay to run an ad that
> most people won't see because
> they are going to fork out money to buy it!

Agreed. One of the Cardinal Rules of marketing is
never to let your potential customers know that they
are paying you a percentage of the advertising
budget! This is a faster turn off than paying retail.
People "like to" or "need to" think that they are paying
ONLY for the product they want to purchase. This makes
them think their getting a bargain deal, except for
big ticket items like Cars and Homes where it's a given..

Unfortunatly The Hamvention people seem to have not
lost their appetite for profits at any expense and
knowing how traditionally cheap ham radio op's are
this is not a good publicity move. (the only exception
being the cost of soda/pretzels/burgers which can be
priced as expensive as those at the dog racing track
and they'll still buy the greasy/carbohydrate packed
stuff)

Look at similar examples like Radio Shack charging
for their formerly free catalog (unless you buy something)
and the numerous sites on the Internet that used to carry
live streaming audio feeds for free, which have now dissappeared
or you are charged a listeners fee for. Radio Shack has
since resigned to giving catalogues away for
free again, if you wait around till March, and dot.coms
who charge pay-per-view/pay-per-listen are just about
all gone to byte-heaven, except of course for the
porno and bizzare sex video on demand websites ;)
[and most of this "pay-per-view" stuff you can now download from
www.kazaa.com for free! Kazaa is the new Napster folks - check it out!)

The general public is tight enough when it comes
to trying to get a dollar out from their wallet
for some things, but just try the same with white male
middle-aged ham radio op's?! You'd have better luck
trying to wrench a canned-ham bone from the
jaws of a junkyard dog. :) :) :)

> I noticed that the Cincinnati Hamfest has reduced

I've been to the old Cincy-hamfest of years past, darn shame as
it was almost as big as the original Gaithersburg Md hamfest.
Same thing happened to the hamfest up in Hamburg NY when it used
to be held at the County fairgrounds. They moved it, now it's a
mere shell of it's former self last I heard. Many more have just
dissappeared without a trace.

> Even with the bad weather, flea market prices are too high and the fools
> won't really negotiate down to reasonable prices for used gear. In some

You can thank E-Bay for that JDB!
Without a doubt the world biggest
24-hour online sucker-hamfest.

Perhaps I'm wrong, but it seems to
me that more than a few of these "professional ham
equipment dealers" I see with E-Bay item sales
and feedback counts in the 100's - and a
few in the 1000's) seem to network
amongst themselves to drive up the base
auction prices on ham gear(??) A bit of
"shill-bidding" here and there...perhaps..??

> A lot of vendors that normally attend were

Cute gimick, but Motorola or Cobra has had a pair
of waterproof "sport" FRS radios out for close to
a Year now for $59.95 in a hanging blister-pack
at WalMart last I looked.

I agree with you 100% on the re-packaging of gear.
I'm one to peek "under the hood" of new radio gear
myself. What's "behind" that graphics-filled LCD?

Yaesu does seem to be the leader in innovation and
I would put Alinco in as a close second. Kenwood and
Icom...?...booring! Just expensive bells and whistle
gadgets in cheap sheet steel boxes. Looking at the electronics
inside of your average Icom and kenwood reminds me of
the insides of a Korean VCR that you can get for $65.00
at Circuit City. (and they REALLY pay 2-3 grand for
some of this stuff...??!! rotflmao!)
Yaesu and Alinco are mostly newer design
SMT with clean layouts and by far a better
value - Alinco I feel has the best dollar per
radio value going.

Sad news on Ten-Tec. The Orion shoud be called the Onion.
Looks like it came off the prototype workbench in the
Engineering lab - with all the bugs still inside. (?)
Iam afraid Ten-Tec will be gone by this time next year.
They used to build great rigs in the late 70's and 80's.
Easy to work on with readily available replacement parts you
could get from Digi-key and Mouser electronics if
needs be. Now their overpricing themselves out of the
market. What Ten-Tec *needs* to do is return to their roots
and build rigs like the Triton and Omni-D series again.

Functional and utilitiarian radio gear that is easy
to operate, maintain, and has minimal gimicky bells
and whistles. Stop trying to mimic the Japs, dump all
this digital pushbutton crap, except for the freq
display, and put more single-function standard type
controls. The Omni-D (..of which I own 2 of) are a
great example. The Paragon was perhaps the best radio
to ever come out of Tenn.

> SGC used to have a good rig with the 2020, but I noticed they screwed that
> up and changed the fixed SO239 on the back of the rig to a pigtail.
> Another component to fail. Also they took away the power plug and now
have a
> pigtail for the power lead. Yikes, on an HF rig?

Agree again, not a good idea to put a mid-power level
RF connector or high current power receptacle on a
pigtail. Anchor female receptacles to the chassis
with bolts and do it the right way. (I hope they
never get the idea to put a spring-loaded cable
retractor/pull reel like what's the power cord of
the XLY's Electrolux vaccum cleaner...oy! I heard one
engineer from Cubic or Azden talking about that
for a DC cigarette adapter power cord many
years ago at Dayton and nearly got sick...)

> APRS is really growing in popularity and there was a really nice APRS

> Of course many of the ills can be cured with more hams.

I could not agree with you more strongly on the "trinket vendors"!
If I am going to PAY an admission fee to a flea market (which is
what Hamvention really is folks!) then I had better see stuff for
sale that I DO NOT SEE at the local every-weekend flea market
just down the road, where the admission and parking is free!!

Case in point, for years this one guy would show
up at all the Eastern hamfests selling new cheap
import luggage and gym bags. No ham stuff period.
Next year he was joined with some other guy selling clothing
and other crap in another section of the flea market.
Again no ham related items whatsoever for sale between them.
I've never been back to the hamfests that let these
turkeys into their flea market and I never will.

I could not make Dayton, and I really hope that
it is not turning into another consumer
products junk market dumping ground! It's bad
enough with all the computer related crap.
All that needs to happen is for somebody in an
overloaded mini-van to show up and be allowed to
start selling cheap imported wristwatches
on rubber banded styrofoam display cases, and you can
then kiss the Hamvention goodbye. (please someone
tell me these wristwatch-dealers did not show up and
were allowed to set up and sell like they did
someplace in NC last year!)

I have a problem with my dj-x2000. Whenever I listen to preprogrammed frequencies and the transmission ends there is a burst of static (i.e. a "squelch tail") before the squelch kicks in. I also have a Pro-60 and when it scans it there is no squelch tail.

Does anyone know how to fix this?

TIA

Some of the 2.4GHz phones are analog and are very clear if they're close by.
Wireless stuff, if you can catch it, is digital hash.

We use Minitor III pagers, they run around $500. You'd be pretty much out of luck with most dispatches though, the VHF system is being phased out by August to be replaced with 800MHz trunked radio. At present the best you could hope for would be to monitor a couple of non-core (outer area) FDs. Buy a trunking handheld scanner instead e.g. Uniden 245XLT..much cheaper and picks up evrything.

Just an ammendment ..I thought I was on a "local" newsgroup (i.e.
Halifax) so the August point is probably moot.. however the fact remains
that almost all emergency services are in the process of switching over
to 800MHz for which the Minitors et al would be essentially useless..
sorry for any confusion :/
(Also that $500 was in Canadian pesos)
Stick with the trunktracker.

That would be a stretch. Cordless phones put out only a few hundered
milliwatts of power, so it's extremely doubtful you would be able to pick it
up five miles away without an antenna that has beaucoup gain. You would
probably need a beam antenna about 50 or 100 feet long up probably about
50-100 feet, which is impractical. Five blocks away is no problem, but five
miles is a bit too far.

In defense of the sale. That was no ordinary 101e. A mint condition Model T Ford brings a little more than the original price too. They aren't very good cars, no A/C, no cruise, no stereo, etc.

Depends on the context in which you may have heard it. SAM = Special Air Mission and SAM flights carry cabinet level governtment officials and top military brass. Can you associate a frequency with the "SAM" you are talking about? That might help. 73, Pat

I assume you're refering to posting links about disguised cell
antennas? There's one at Mt Vernon, VA, the home of our 1st president,
Geo. Washington. You'd never realize it though, because it's disguised
as a tall tree. The association that runs Mt Vernon allowed the tower
to be constructed on the prime piece of real estate in exchange for a
new repeater system being installed for their own use. This was
several years ago. Sorry, don't know of any links that talk about this
system and I haven't searched for any.

>DARA had to do something to recoup their losses.

I agree that $5 isn't going to bankrupt anyone at the Hamvention,
but there is also a matter of principle involved. I'm sure there
are tough pricing decisions that the DARA people had to make, but
I found this one particularly onerous, and made more so by DARA
neglecting to inform people of their decision beforehand. I was
frankly offended, as much as I would be if a restaurant I frequent
suddenly decided to impose a surcharge but neglected to mention
the fact before presenting the bill.

The decision to ding people for a program is simply a bad one and
we should be unequivocable about letting the people who run the
Hamvention know that.

Sure! Bascially trunking is a method for a lot of users (maybe a large city police force or maybe several different agencies in a smaller area) to share a number or frequencies (5 seems to be the minimum). Instead of an agency being assigned to a specific frequency, that agency and all of their radios belong to the same "talk group". The talk group uses all of the frequencies in the trunked system in a seemingly random fashion. All radios on the same talk group will hear all transmissions from other members of their talk group regardless of what frequency the transmission is made on.

Pick up a copy of Police Call from your favorite online radio shop or the next time you drive by a Radio Shack. There is a good section in the front of the book that covers a lot of radio principals and includes a good amount of useful info on trunking systems. When you are done reading that, they give you a whole bunch of frequencies to try out for free in the rest of the book. Mine came with a CD, too.

Not a bad write up, but there is a thing or two off. First thing is that
he doesn't mention that trunking is used in the 500 MHz band as well.

No you dont need two scanners to listen in such a situation. Two frequencies are necessary in a repeater system. One frequency is the input and the other the output of the repeater. You only have to listen to the output frequency to hear both sides of the conversation. A repeater is a piece of equipment that receives input signals from low powered handheld and mobile radios on one frequency and then retransmits that same thing on a different frequency with much higher power. Repeaters are usually located in high locations so that people are able to just use hand held low powered radios to talk to each other from very long distances. The input frequency is not always sent to the output of the repeater. In which case you will only hear the dispatcher and not the mobile in the field. Sometimes I do use two scanners to listen to the two frequencies, but only to experiment. If you are close to the input transmitter, lets say a taxi cab, you can listen to it on the input frequency on one scanner and also listen to the output of the repeater on a different scanner. Ok it`s a cheap thrill but its just to learn stuff.

Us the SEARCH feature on the scanner to build your own frequency list. I have never
seen any information on Croatia. You might want to check out the
frequency board, look down at the bottom
over at <http://www.strongsignals.net> go to the FAVORITE PAGES then scroll down to
message boards and click on "frequency". Doing a search and finding frequencies is a lot
of work but its rewarding, Is it legal to have a radio scanner receiver over there? You may
want to get a pair of walk man head phone to use with the scanner.

If there was you would also pick up every other cordless in a five mile radius - some 75 square miles ! And, if you were in a city, your scanner would just scream out a jumble of noise.

I purchased a Vtech 2931 900Mhz phone.
http://www.vtechphones.com/vtechui/shop/productdetail.cfm?itemid=218
I broke out the frequency counter and pulled up the numbers. I then used a BC2500xlt to listen in. I heard "nothing". There was no carrier. No garbled noise, nothing. I then swept the freqs up and down a bit with the scanner. Still nothing.

I then popped in a loop from 900-1Ghz. Nothing, except for birdies and other junk one might hear in that range that isn't digital. ;-)

I don't know about spread spectrum, but I feel somewhat at ease that Nosey Nick the neighbor can't listen in nor record and decode the DTMF tones as I key in my sensitive information.

Does anyone know what happened to the pentagon audio files located at http://briefcase.yahoo.com/bc/trunkedsystem? There is nothing in the pentagon folder, but it seems that the files are somewhere in the briefcase site since most of the 30 mb file limit is being used.

3398. Optoelectronics Xplorer Help

I just bought a used Optoelectronics Xplorer.
I did not get a manual with it. Is anyone able to make a copy of a manual for me or know where it might be posted online? A quick simple email with a few how to`s would even work for now.
Also, is it possible to unblock the cell portions of it? Most likely useless anyway since its all digital, but would still be nice to have no blocks.
thanx

The answer to your grounding question is a resounding NO!!!!
While grounding the signal wire would probably remove static charges
from your antenna ie; static voltage placed there by the wind, the
wire is simply too small to carry any substantial current to carry a
lightning charge or even a 60hertz power contact. You'd need at least
a #6 wire and a good water pipe or ground rod type of ground.

3401. FS: SMA-to-BNC custom fit antenna adapters

Newsgroup: rec.radio.scanner
Date: 2002-05-24 00:14:20 UTC
From: gulyas@earthlink.net
Message-ID: <12235960.0205231614.2a960ac4@posting.google.com>
Source record: 47969
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.swap,rec.radio.scanner

Do you have a need for a high-quality SMA-to-BNC antenna adapter that
is custom made to fit and protect your H.T. or scanner radio?

Adapter allows you to:
Quickly change antennas to base,mobile or different style use.
Use the more popular and wider selection available of BNC antennas.
Prevent chassis connector wear or from coming loose due to antenna
changes.

Adapter features:
Gold plated contacts with a teflon insulator.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed
for moisture and dirt protection.
The base also provides an excellent support for any length of antenna
or application.
No need to remove adapter once installed to make a quick and safe
antenna change.

Sizes to fit radio models:
Yaesu: VX-5, VX-1, FT-50-R, VX-10, VX-150, VX-110, VXA-100, VXA-120
Icom: IC-T8A, IC-T81A, IC-Q7A, IC-R2
Kenwood: TH-D7, TH-G71, TH-F6A
Alinco: DJ-V5
Standard: C508A, C510A
Radio Shack: HTX-200, HTX-400, HTX-245
Aor: AR-16

Previewed in the May 2000 Issue of CQ Magazine, and the Nov. 2000
Issue of QST Magazine.

$11.95 + $1.50 S+H(One to unlimited)
(Check or money order only in U.S.Funds)

I almost bought an Xplorer when they were first introduced, but they were $1000 devices without an industry track record, and there were plenty of terrific options for less.

Now that I'm no longer a novice scanner enthusiast, I've learned to appreciate pioneers like OE, and regret not buying the Xplorer when I had the opportunity.

It seems government agencies get all the unblocked versions at reduced costs, while the consumer pays top dollar for the disabled ones.

A nice, fair FCC arrangement, eh?

Unless the new Xplorers are rendered unrestorable by the factory, you might check with mod shops. There are plenty of private pro's who will do what's necessary.

Source record: 47980

Handheld scanner;

I've gotten my moneys worth out of my BC 200 XLT. Our town has gone to trunked. I'm not sure what type. I'd like to get another scanner for commercial band services, aircraft and 2mt HAM band since I'm a HAM.
I noticed that Uniden does not sell all the units on their web site that are for sale at other places. So I'm thinking that maybe they are just selling the latest models or the models they plan on keeping in production. I guess I would also like all the channel storage possible as long as it doesn't shorten battery time. Our local city services are at 866-868 MHz so I will need UHF. And I also need 144 - 148 MHz for late night HAM listening.
Of course I've been looking at the Uniden BC245XLT. But I've heard there are 1000 channel models out (RS I guess) and I think the digital ones are for sale or near FCC type acceptance.
So how about some suggestions. I got lots of hours of monitoring from my 200XLT. Thats cheap entertainment. It's been so long I can't remember when I bought it. It was a real work horse. Please pass along any "lemons" you know of. You can email me anonymous lee@texw.com I don't want to get anyone upset about their radios.

Many-Many Thanks, Lee

>> A nice, fair FCC arrangement, eh?

As misguided as some of their actions are, the F.C.C. isn't the culprit behind frequencies being blocked in scanners and other hobby items.

In this case, they are just carrying out the legislative actions of Congress.

Credit for blocked scanners is the result of the "cozy" financial relationship between some of our politicians and the telecommunications industry ... "you support my campaign, and I'll support legislation that helps your business."

Milt, the FAR hamfest moved from Gaithersburg to Bowie MD. It's still
pretty big.

>Cute gimick, but Motorola or Cobra has had a pair
>of waterproof "sport" FRS radios out for close to
>a Year now for $59.95 in a hanging blister-pack
>at WalMart last I looked.

I wouldn't call that a gimmick. That's something worth doing.

>I agree with you 100% on the re-packaging of gear.

>some of this stuff...??!! rotflmao!)
>Yaesu and Alinco are mostly newer design
>SMT with clean layouts and by far a better
>value - Alinco I feel has the best dollar per
>radio value going.

Frankly, I think you're rant lacks basis. Kenwood, Yaesu, and Icom
have been leapfrogging each others achievements for years. To say
that the other's stuff is suddenly "boring" says very little about
what's coming.

In my personal opinion, they're all garbage next to the likes of the Elecraft K2. That's a REAL radio.

>Sad news on Ten-Tec. The Orion shoud be called the Onion.

>great example. The Paragon was perhaps the best radio
>to ever come out of Tenn.

I have one of those "great rigs" from Ten Tec and the 1970s. The dynamic range was awful, the packaging was flimsy, and the radio itself was hardly a model of stability. This digital push button stuff is the future for mass produced radios. It's cheaper, more stable, and it frankly performs better than most mass produced analog gear.

Yes, you could build an analog radio with better overall performance than a lot of this new digital stuff. But you'd have to invest a lot of careful component selection and tweaking to get it running. And that would cost more, *much* more than you'd be willing to pay.

While criticism of a radio's performance/price ratio is valid, your notions of what's a good construction technique or design choices is pointless. Try building a few radios of your own before spewing this nonsense about other manufacturer's choices.

>I could not agree with you more strongly on the "trinket vendors"!
>If I am going to PAY an admission fee to a flea market (which is
>what Hamvention really is folks!) then I had better see stuff for
>sale that I DO NOT SEE at the local every-weekend flea market
>just down the road, where the admission and parking is free!!

Then don't spend any time or money on them. They'll get the idea and not return. The problem I have with your approach is that determining this sort of thing up front is fraught with problems and potential law suits. Your definition of what a "trinket vendor" is happens to be a judgement call.

>I've never been back to the hamfests that let these
>turkeys into their flea market and I never will.

Good bye.

>I could not make Dayton, and I really hope that
>it is not turning into another consumer
>products junk market dumping ground! It's bad
>enough with all the computer related crap.
>All that needs to happen is for somebody in an
>overloaded mini-van to show up and be allowed to
>start selling cheap imported wristwatches
>on rubber banded styrofoam display cases, and you can
>then kiss the Hamvention goodbye. (please someone
>tell me these wristwatch-dealers did not show up and
>were allowed to set up and sell like they did
>someplace in NC last year!)

What's it to you? If you're offended, don't go. Did you buy any antique radio gear? Were you offended that they were there, even though we're talking about old radios which were left over consumer items from the 1920s and 1930s? Get over it.

If you don't support a hamfest by attending one, then, well, there's always E-Bay. Don't like them? Gee, Mr. Grouch, what do you like? This rant is like cursing at the weather. Grow up.

First, they're probably a few MEGAhertz off.

Second, these are probably repeaters. Whatever is on the input (a 2-watt handheld radio with a teensy antenna) also appears on the output (a 150-watt base radio with a huge antenna 100 feet up). It's usually not worth scanning the input frequencies; MUCH easier to hear the same stuff on the output frequencies.

Trunking: "A very expensive radio system originally developed by Motorola
and a few of her "bastard child" competitors, that has been responsible for
numerous repeat emergency calls by dispatchers, garbled transmissions, and
in some ways is more vunerable to being put out of action by terrorist
activity due to it's reliance on NET hub/router "piggybacking" in urban
areas because of interference from everything from cellular telephone
services to wireless ISP." Still a "work in progress", but one that just
may fall down like a house of cards, should some ragheads for Usama
take out a major telephone exchange or satellite uplink service in
any one of dozens of urban areas. As my college physics Prof. said
to us once: "Anytime you make anything more complex and reliant on
inter-working or networked systems for it's operation, it's that much
easier for a common gray squirel to climb into the equipment cabinet
and wreck havoc by peein on and shorting out the cables"

Another definiton might be:

Trunking System: A system that works damn well when a conventional system will also work well. But, when the chips are down, when the conventional system will barely work, but barely is better than not at all, the Trunking System is a system that gives up the ghost and is completely dead and useless.

Ask the NYFD members, they may have a few choice comments.

72.5800 mhz. is a low power assigned frequency to various radio services. It IS NOT an assigned frequency to the "PW" service which includes fire, police, local govt. and rescue. You probably are hearing an image of another frequency possibly in the 150-160 mhz. range.

3437. Need a little help with Opto Scout

Newsgroup: rec.radio.scanner
Date: 2002-05-25 00:46:19 UTC
From: Steve Matzura <number6@speakeasy.net>
Message-ID: <mplseuouvqnuh4d7upofq0pkfb9vns7mof@4ax.com>
Source record: 48003
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I recently purchased an Opto Electronics Scout frequency counter, or, should I really call it a frequency-grabber. It's an amazing little gadgie, what with its Reaction Tune feature, coupled with the Scannermaster SmartLink interface, there's nothing I own that it can't tune or download to.

But I'm having a bit of trouble understanding some of its rather terse manual. I can reaction-tune my BC245XLT via the SmartLink box, but for the life of me, I can't get the thing out of CI-5 mode to RT my AR8200. I'm usually good to excellent when it comes to understanding and interpreting manuals, and what I don't understand, I can usually hack out, but not this time. The position of the two front-panel switches I know has a lot to do with it, but exactly when do you press the push-button to change from CI-5 to AR8000 mode, for instance?

Another thing I'm trouble wrapping my head around is this. The unit has two phases of operation--initialization, and normal operation. The unit's function depends on this switch-setting business. Let's say, for example, that I want the LCD back-light and beeper to be enabled at startup, which means both switches have to be in the up position, but I don't want the thing to be in memory mode where it captures a frequency and stores it in memory, I want it to be in what they refer to as "free-running frequency counter mode" with no storage. After the unit initializes, do I then move the switches down? It's a little confusing when you have things that work this way, with two switches controlling two phases of operation with four options each. Any assistance would be greatly appreciated.

In Virginia, Nextel "owns" almost every frequency from 851.000 mhz. to 869.000 mhz. excluding those specifically assigned to other users, i.e., trunked business, police, etc. As I understand it, certain models of their hand held phones have the capability to T/R receive, obviously in the 800 mhz. band and probably on a selected 806-820 mhz. input frequency.

Per a recent newspaper article, Paypal is being sued for patent infringement and being investigated by the Justice Dept. for possible illegal practices. Only fools would use Paypal these days. In Dec 2000, I wanted to sell some items on Ebay. I was forced to provide a credit card number. I used an "emergency" second credit card that had not been used in 2 years. In Apr 2001, I was contacted by a company in Nebraska that monitors Visa and Master Card purchasing profiles. My credit card information had been hacked on Ebay. The hacker purchased over $2,000 of computer equipment via telephone and the greedy vendors who sold it to him, suffered the loss financially...not really, most prices are jacked up to cover sales losses. I canceled that card and received a replacement. The first indication to this company that something was wrong was the hacker used a good area code but a bogus telephone exchange prefix. If my credit card information was stolen, you can imagine that thousands of others were also. Ebay's on line security obviously SUCKS!

Source record: 48008

Can anyone point me to some basic memory-management software for the RS Pro-2053? If so, that would be much appreciated.

(Fwiw, I know there is a Pro-93 Yahoo group that probably contains this information. I tried to join it this morning. For whatever reason, it's not possible to join that group without the moderator's permission. Don't believe me? Try it.

(In any event, I guess the moderator is out of town this weekend, I haven't heard back. Whether he is or isn't out of town, shit like that ain't for me.)

Thanks!

3443. FS: W4UVV Virginia Frequency Directory 2002 Edition

Newsgroup: rec.radio.scanner
Date: 2002-05-25 02:01:09 UTC
From: John Wilson <jwilson9@erols.com>
Message-ID: <3CEEF064.64E50184@erols.com>
Source record: 48009
Cross-posted to: rec.radio.scanner,rec.radio.swap

The W4UVV Virginia Frequency Directory 2002 Edition in its 17th year of publication now is available on CD ROM. The Directory contains over 100,000 frequency listings from approximately 25-2,600 mhz. Services include Police, Fire, Rescue, Press, Aviation, Military, Federal, Marine, Business, and Utilities. Frequency relationships include repeater I/O, Simplex, T/R, Fixed, Remote Transmiter/Control sites. The database record data field's format is:

FREQ1(Frequency 1), FREQ2(Frequency 2), SV(Service), CALL(Callsign), USER(Licensee/user), CITY(Transmit City), COUNTY(Transmit County),LAT(Latitude), LON(Longitude), TAH(Total Antenna Height), B(Base), R(Repeater), M(Mobile), P(Portable), WATT(Xmit watts of base or repeater or mobile or portable), PL(Analog or Digital CTCSS) and CH(Channel). Database record formats include: DBASE3/Text for MS DOS users, MSEXCEL for Windows OS and Clickbook 2000 for Windows OS for front/back page printing. There are some federal and military listings included for Maryland, DC, and North Carolina.

Each county and independent city has its own extracted file in the aforementioned formats from the master file. This feature allows the user to customize a viewing profile for his monitoring area of interest by deleting services of non-interest such as pagers, etc. and resorting of information by different file sort sequences.

There is NOTHING comparable to it. Additionally included are certain frequencies actually monitored off air and NOT found in the typical scanner publications offering only basic information that may or may not be correct. For example, since events of the past summer, a new "in the clear" federal user is operational; a new central Virginia metro police a/c frequency has been monitored. There's a new Post Office frequency operational. This frequency/user information is NOT on the internet, in Police Call, Scanning America or anyone's personal requency webpage. These and other "interesting" frequencies such as video and audio surveillance frequencies for certain users included in the directory.

The master directory occupies approximately 12 megabytes hard disk storage space. Printed at 4 font, 80 records per page, the master file is approximately 950 pages. To sight check each listed record for 10 seconds @ 8 hours straight per day would

take the viewer approximately 35-40 calendar to view the master file one time. Among past directory users have been three TV station news departments in state.

See the October, 2001 issue of Monitoring Times for a product review of the W4UVV Virginia Frequency Directory.

The CD ROM is available for $75 that includes USPS shipping within state. 24 hour workday turnaround except for personal check orders. Allow 10-14 days delay in shipping for personal check orders. Interested purchasers can send an email to: <jwilson9@erols.com> and request a copy of the Directory's User's Manual and a Readme1st file for more explicit database file formats and ordering information.

It allows an interface to an external analog and/or digital CTSCC decoder to the scanner. These devices require unfiltered audio. The scanner's audio is filtered and in doing so the low frequency "pl" subaudio carrier tones are not passed.

By design discones have little or no specific frequency gain. The Scantenna looks awful, but does a great job except from 406-420 mhz.
The Radio Shack VHF/FM/UHF TV mast mounted amp @ approximately $60 will work most excellent with the Scantenna. I have 4 tower mounted at 125 ft. among other antennas. They are directional to a degree and so far they have outperformed other comparable pre-amped antennas I have tried.

I have been going to the Dayton HV for 22 years now and I have seen allot in those years, but Ebay is ruining ALL hamfests. A couple of years ago a person with a very pronounced New York or Bronxish accent came to our local Cincinnati hamfest and bought everything in site that was reasonably priced. It didn't matter what it was. While at a table I overheard this conversation. Bronx "How much is this?" Seller "$50.00." Bronx "Not worth it. I'll give you $30.00" Seller "Wellllllll OK." The seller proceeds to bag the item. Bronx to friend while still in easy earshot of seller "I'll get $125.00 for this one at least on Ebay!" Resellers like this one are truly what is killing Hamfests. If I was the seller and heard this, why would I bother taking an item to any fest? I'd sell it on Ebay and pocket the $$$ instead of making someone else rich.

I can provide you with a loop yagi antenna and other system components for monitoring the AOR-West and depending upon where you live in the US, possibly the AOR-East INMARSAT satellite. Be advised you cannot monitor INMARSAT with only an antenna and receiver and absolutely no way with ANY inside antenna. See my 2 part Monitoring Times Feb/Mar 94 article on how to configure a system to receive
INMARSAT FM SCPC signals. You can email me at: <jwilson9@erols.com> for further information/component pricing, etc.

Per reviews I have read about the ICOM R3, they conclude its performance at 2.4 ghz. as AWFUL. The video demodulator is insensitive and it "eats" batteries and is warm to the touch. Additionally, FYI most of the "interesting" frequencies are ABOVE the 2450 mhz. cutoff of the R3.
I am researching a magazine article on this new facet of monitoring and hope to have it published. It may not be because of the sensitive nature of the subject matter. In any event, I have compiled a 50 state 2 ghz. directory of users from various sources. It presently is in draft and I hope to offer it commercially this summer. It will be the "USA Video Surveillance and Radar Directory" on CD ROM and contain interesting frequencies for law enforcement, race cars, wildlife monitoring, Fire Department thermal imaging, aircraft manufacturer's flight testing, temporary airbornevideo downlinks for special events such as golf tournaments, races, parades, TV station remote broadcasts and links, etc. The price will be $25 which includes shipping. Anyone interested in the unit or directory can contact me via email.

For the past couple of months I have been beta testing a 5 inch B/W video monitor with a built in scanning feature from 2.3-2.6 ghz. It is powered by 12 VDC and works as advertised. There is NOTHING comparable available anywhere. Don't be mislead by claims of short distance reception. I have had some "hits" up to 1/2-1 mile+ distance from the source. It sells for about the cost of a current radio trunking scanner. In mobiling around a 20-25 mile area where I live I have had several "interesting" video monitoring hits.

I think a more realistic explanation is a 137 mhz. polar orbiting satellite passing over and overloading the IF of his receiver/scanner. I had a similar experience years ago while mobiliing and it also happened in the 418 mhz. range. If the audio had a "ching-ching" sound with the fax sound, that's what it was.

It has been several years since I listened to the ships during fleet
week, but I recall most of the marine frequencies in the 156 mh area were
busy. The port of new york frequency which may be 156.65 (I'm trying to
remember). But if you just scan those marine frqs in the range of about
156.6 up to around 157.2 you should hear a lot.

I have owned this radio since 1989. it has been in the closet since 1993.
It had developed an audio problem all of a sudden one day.
the volume control works but the audio is very very low. it is the same from
the ear plug as well as the regular speaker. you can hear that the audio is
getting distorted just like it should when you crank the volume up but it
just isn't load at all.
does anyone have any insight to this problem of mine?
any help on this problem is greatly appreciated.

Sure; But those are same guys that would buy up everything at opening first day and move it to their table and mark up 200%. And sellers like that either are motivated to sell or unaware of what they have to sell. Nothing has changed at all.

Unfortunatly, we saw an example of how trunked
radios were useless, recorded on video for all time
during CBS Television's documentary "9/11".
Short range fireground communications work best
on VHF or UHF simplex, an have done so since the 50's.

In comes cellular/trunked radio and the whole thing
goes to pieces in actual emergency situation when
the technical infrastructure (power cut and antennas
destroyed atop the former #2WTC Tower) is eliminated.

> RS Pro-2053? If so, that would be much appreciated.

Get Don Starr's WIN93 software, best and it's free:
http://www.starrsoft.com/freeware/Win93/index.html

You can get a programming cable (no adapters needed)
to use w/ the above here: http://www.pro93.com/

Enjoying your 2053? I am :) I have several other
scanners (AOR8200, PRO90, PRO-2006, etc) and I use
the 2053 most of the time. Thinking of selling some
older scanners and getting a PRO93, then I could
clone the programming and have the same setup for
base and handheld ...

OK, so it's not technically a scanner - but you can spin the dail like the dickens if you want <g>

Radio Shack SW-100 Model 12649
Multi-band receiver
Black, UL Labatories listed
Two carrying handles and shoulder strap

AM, CB, SW1, SW2, FM, TV1, TV2, Air, Weather, VHF

Frequency selector, Tuner, Fine Tuner, AFC, Radio/PA, Power, Volume Tone

Internal FM antenna, AM directional antenna, and plug for shortwave antenna. Plug for earphone and microphone.

Uses built-in A/C power cord, 4 'D' batteries, or external 9-volt power
supply (not included)

Frequency ranges: AM - 530 - 1710 Khz; CB Channels 1 - 40; SW1 & SW2 - 4 - 12 Mhz; FM - 55 - 108 Mhz; TV1 - Channels 2 - 6; TV2 - Channels 7 - 13; Air, Weather, VHF - 108 - 175 Mhz

For detailed specifications, go to www.radioshack.com and search for 12649

Expires approx. 6:00 PM CDT 2002-05-25/

Here's some things you can check without performing
surgery on the PRO-2005:

1) make sure the mode is set to NFM, not WFM if you are listening
to police, fire, etc.

2) Have you used the external speaker jack located on the rear panel?
Sometimes the contacts in that jack can become dirty and attenuate
the audio output. You mentioned using an earphone (jack located
on the front panel). Try connecting an external speaker to
the jack on the rear panel. A small squirt of electronic contact
cleaner in the jack may help.

The other possibility is a defect in the audio output stage; an
electrolytic capacitor for example.

I have two PRO-2005s and it is a fine radio.

Hey Steve,

To change the comm language to match your AOR 8200, just do this:

1. Turn the unit on
2. Wait one second, then slide the filter switch to OFF
3. As the unit initializes, you will see the new language displayed on the screen.

That's it! Now you can slide the switch back to ON if you wish. Also, in order for everything to work, your AOR should be turned on BEFORE you turn on the Scout.

Hope this helps.

Jeff Singer

Pictures: http://wind.prohosting.com/w3x/pro-46.html

I have a Radio Shack PRO-46 for sale. The date code is 8A3.

I have tried the keypad trick and it works, allowing you to search the upper cellular band. You can save cellular frequencies to monitor memories and transfer them to channels to scan them like regular frequencies. You can't, however, directly enter cell freqs (normally you won't have to do this anyway), though this scanner can be modified internally if you want it to do that. Of course, I can't be held accountable if you try the mod unsuccessfully and ruin a perfectly good scanner. :)

I am asking $125 plus actual postage for express shipping from Canada (around $10). There are no customs fees for you to pay.

Please don't hesitate to e-mail me directly if you are interested, or if you have any questions. I will be happy to respond to you promptly.

This implies that I should start out with the Filter switch set to
OFF. Correct? What if it's in the OFF position already before I turn
it on?

Simple, they offer a service. Like a real estate broker, or a check cashing service.

You send them $100. They forward $99 to the person you owe. They make $1.

Their asset is the "goodwill" of their customers. Apparently that goodwill is not universal.

Thank you Bob,
All the above have been tried. I was expecting a surgical procedure which I can perform even though I am not medically qualified. I was hoping to find someone who has experienced this type of problem and have had to replace components so I might have an Idea as to which components to look at.
The audio is there, it just does not have any drive behind it.
Again thanks very much Bob.
I have to scrub up now.

>>Gee thanks Stephen but I'd rather got to <somewhere else> and buy
<an inferior product for less money>...

There's no comparison between the all-metal units you see for four
bucks, and the product that Gulyas offers.

Gulyas' adapters are tailor-made for different HTs - they take into
consideration the minor differences in spacing and are vastly superior
to the "all metal" units available elsewhere. They protect your HT's
antenna connector by providing "shock absorbtion" spacers that
custom-fit HTs.

Hi all:

Thanks again to every one that stopped by
our sales booth, space #3257, and especially to those
of you that purchased something. We still have a few
of those Maxon Programmable PL Encode/Decode boards
left for sale at $19.99.

Talk about all those great deals again this
year at the hamvention. Maybe that rain late Friday
afternoon had something to do with it. What about
those inside dealers selling BRAND NEW STUFF below
cost again this year. Can you believe it, a Brand
New IC706MKIIG with the $80 RMK-706 Separation Kit
option for ONLY $699. How about Brand New Tri-Band
Kenwood TH-F6A for $299, I went in at 10:00 AM
Sunday (2 hours earlier than I normally do) and made
these two big purchases. No SALES TAX, and Shipped
Free to my home. Both units arrived via UPS
yesterday afternoon.

This year, Sunday at "HIGH NOON", I was in
the outside Flea market making a killing. I bought
6 used 12 VDC power supplies made by Astron Corp.
(equivalent to their model RS-12A , 3 of them even
have speakers built inside of them, so cool) for just
$5 each. Also found a few (4) of my favorite mobile
radios, Motorola UHF PL Maxar 50's for just $10 each,
and two of the Maxar 50's even came with mics and mobile
mounting brackets. I bought a mint Decibel Products
220 Mhz (my favorite band) 4 can high power base duplexer
for only $40, and 3 used Celwave 6 can UHF black mobile
duplexers for only $10 each. Hey some guys still try and
sell those Celwave UHF mobile duplexers right here on this
N.G for $150+. I had many other great buying deals on
the other three days (Thur - Sat) but by far my "Sunday
HIGH NOON" deals where the best! Got home late Wednesday
night, and still haven't had enough time to put everything
away yet. Thank goodness its a long, 3 Day Holiday weekend

Until the next 2003 Hamvention, Rain & or Shine.

I'm looking for a nice easy to use scanner that also receives AM-Radio, FM-Radio and TV sound. What would be a decent model? I have an Alnico X10T, but it's a little too fancy for me, so I'm ready to trade for a simpler easy to use model.

Thanks,

Patrick

The Alinco DJ-X3 comes with those modes pre-programmed. Very easy to use unit. I've been using one now for a short while and I like it.

I wish I would have went back on Sunday. The flea market
prices on Friday and Saturday just sucked. Prices were WAY to high.
Most sellers wanted next to new prices for used stuff. Some
were asking higher than Ebay prices! Went inside and
bought new items. Why spend $125.00 for a used item when it is being
sold inside brand new for $129.00?! My father in law saw a matching
Drake speaker for a R8B and the guy was asking $60.00. When told you
could buy it new from Universal Radio for $48.00 he said "OK How about
$45.00." For the extra $3.00 he will by it new.

Randy KB8ASO

p.s. If I wanted to pay Ebay prices, why spend $17.00 to get into
Dayton, $16.00 to park, $30.00 for gas etc..... Might as well
buy it on Ebay. It is less expensive, no two hour drive one way,
delivered to my door and with the integrity of some hams lately, there
is no less risk of getting ripped off!

I agree with caller # 2. He forgot $5 for a program. HQ 180 waxed up $700.
Clean Ranger $600. I assume they went home with their gear.

This petition is meant to show Blockbuster Video that the DVD community does want rent and/or purchase widescreen DVDs. The film studios actually listen to Blockbuster, and if they see that Blockbuster is only stocking Full Frame DVDs, it could ruin the entire DVD format for those who enjoy true film.

My 2005 is still running fine since I bought it new, so while I haven't seem this problem there is one thing I thought of that Bob didn't mention. Have you checked the attenuation switch in the back? While I don't think that would cause the problem you describe, I thought it was worth mentioning.

I'll check my 2005 service manual and see what it suggests for this problem and post back later tonight. I'm guessing a bad cap or audio amp just from experience with other types of receivers. Sometimes a bad cap is easy to spot. If they are leaking they have a crusty residue along the top of the cap and they should look a bit "fat" and bulging. Maybe something to keep you busy while I look for more suggestions!

Well spoken all of you guys..

One of the items I wanted to purchase was a Dummy Load.
All over the flea market there were Bird 500 Watt units that ranged from
$120.00 to $500.00 for the same unit in various conditions.

I finally made my purchase from the person who was across from Mendelsons
for $120.00, and the unit looked brand new.
I was very happy with my purchase, but if you were not careful,
you could easily pay to much for something.

I will return to Dayton, but will continue to make my shopping list
before I leave, and price the items first.

It was very repetitive to here sellers in the flea market say..
"The price is.., and if you don't buy it, I will put it on ebay."

I have not been to Dayton in 15 years, but it was amazing to
see so much "Junk" that people were trying to sell.
Some of these rigs looked like they left them out in the rain
on Friday and they wanted prices that would outweigh
the risk in purchasing them.

Thank you.

> Enjoying your 2053? I am :)

Very much so. I am surprised by much it picks up. I live in an area
that is fairly hilly, and I'm currently getting more than I want to
receive. I think I will be even happier once I figure out how to
control the memory. For the bucks, it's a very impressive radio.

I will add that I have no complaints about my local Radio Shack
store. People tend to pan RS, and I can understand why. The store
where I used to live was worthless. The one here is very good.

well,
even genius level people have spelling problems (look at Einstein. He had
trouble with basic math).

We are all cursed on some way. I'm not the world's best typist, but I am
a better orator than writer. I can crunch numbers in my head all day
long, but don't ask me to write (as you can see, I'm not real good at
it).

As for jokes, it would help to see a few "emoticons".

I know this seems a little old and is definitely off topic.
However, I have one solution that I know has worked.

if you have to use places like "paypal", then setup a seperate account
just for that purpose. This way, the only way they can take money is if
there is any to take.

Thanks for the replies. Most of the links you find on this radio are dead now. It's a shame because It's not a bad little receiver if it just had some good software. I guess I'm one of the minority who doesn't really care for TalkPCR. It seems to have all the features I want but the interface just seems to be lacking.

First off, this has nothing to do with Radio Scanners. Secondly, letterboxing SUCKS, period. There is little or nothing happening out at the edge of the screen in these so-called "wide-screen" epics, and it makes the images so damn small you need a magnifying glass to make them out. Somebody had to say it, plain and simple..Letterboxing - a good example of how to ruin an otherwise perfectly good movie.....

Hash: SHA1

I have a Radio Shack dipole antenna I have been using on my BC855XLT
for the past few years with no problems (except for the fact that
there's really not much to listen to up here in Fairbanks, Alaska!).
I am in the process of acquiring a new BC245XLT next week and am
wondering if I can connect both scanners to the same antenna. One of
the reasons I'm getting a new scanner is related to the fact that I'm
getting ready to move to Omaha, Nebraska next month and will
most-likely have a lot more to listen to once all my stuff arrives
and I get everything setup again.

Anyway, if connecting both scanners to the same antenna is not a
problem, what kind of splitter should I use? I suppose it would be
quite similar to connecting two TVs to the same antenna except for
the fact that the cables are quite different.

I've got a Radio Shack up here where I can purchase the required
parts, but the folks who work there aren't very technically
proficient. :-(

Thanks!!!!

Charles
Fairbanks, Alaska

p.s.--If anyone wants the Eielson AFB military freqs, email me.

Take a look at www.stridesberg.com/prod01.htm. Unfortunately you won't find these at Radio Shack, however these are the splitters you are looking for. They protect each rig from the other(s) and come in passive and amplified models covering HF, VHF, UHF, and 800 MHz in different models.

I had a Pro 2004 with the same problem. The coupling cap between the audio amp and speaker was bad. It was bulging at the top. This would be C226 on the Pro 2005.

With the unit disconnected from any power source, check the resistance to ground on the center pin on the board leading to the volume control. Should be around 33k with volume set to max.

Have you tried an external speaker?
How is the audio level on the tape out jack? If it is ok there, the problem should be around the audio amp.

Heck, with that kind of $$$ I'd get a BC780XLT or PRO-2053 for home and a PRO-94A to carry around. That's about $550, so you have enough left for some coax, a Diamond discone antenna, mast, and mounts for the 780 and a Diamond RH77CA antenna for the PRO-94A.

That little comment burns me to the core. I feel that these people look for a sucker that does not know current values. The thing that is amazing is some were asking HIGHER than Ebay prices! That is the deal? None for the buyer, that is for sure. Used equipment going for more than equivalent new gear? Bet that makes Yaecomwood very happy!

It is up to us to call them on this. If the say "The price is.., and if you don't buy it, I will put it on ebay." The response should be " Why didn't you? Instead you are here wasting my time and flea market space! Please leave and list it on Ebay." Maybe they will get tired of hearing this and price their gear to sell or stop coming to hamfest all together. It would be no great loss.

You are so right. If you want to get Ebay prices for your goods then stay home and put it on Ebay. Save the space for the people that want to sell items for a reasonable price like a flea market should be. I know that might make the flea market half the size it is but atleast I won't have to waste time looking at the over priced stuff. The good thing about that is DARA will lose money on the spaces they don't sell and maybe they will remember what being a ham and flea markets are all about. Because all they think about now is how much they make.

Those 72 mHz freqs are used very rarely as links to transmitters and repeaters. So it is conceivable that some agency is using it as an intercity link or repeater link.

Also, it doesn't necessarily need to hit the water table which in some areas may be several hundred (or thousand) feet down.

But, what I think badfood was alluding to is that the surrounding soil needs to be moist. At 8-10ft, it takes longer for the soil to dry out (and there is that much more surface area in contact with the earth). During dry spells, people do actually go out and water their ground rods. In some places where you can't dig more than a few feet some make a shallow grid of rods and bury that.

You can also make a "deluxe" ground system by increasing the conductivity of the nearby soil with salt and filling the top 2 feet with rock instead of soil for better water penetration. There are examples of how to do this on a lot of SW DX pages.

I didn't think I could just use a standard BNC "T".

Thanks for the info, guys!!!

Charles

Hi,
I wrote an article about connecting 2 ants to one scanner. You can read
this artical at http://www.milaircomms.com/review_stridsberg_mca204.html

Thanks,
George

OK here is the scoop.
The audio level is the same on all audio outputs.
it is there but there is no ampification or drive.
The board looks fairly clean except for C222, C229, C230 and C231
They all have this dark brown crust like substance under them.
I would say if you spilled a little CocaCola on a the boad it would probably
look the same. the reading on the center pin was 34.66 k
I really appreciate this help.
thanks
<M2310@webtv.net> wrote in message
news:12128-3CF11C67-194@storefull-2336.public.lawson.webtv.net...
I had a Pro 2004 with the same problem. The coupling cap between the
audio amp and speaker was bad. It was bulging at the top. This would be
C226 on the Pro 2005.

With the unit disconnected from any power source, check the resistance
to ground on the center pin on the board leading to the volume control.
Should be around 33k with volume set to max.

Have you tried an external speaker?
How is the audio level on the tape out jack? If it is ok there, the
problem should be around the audio amp.

I assume your using coax. Easiest would be a (cable) A/B switch at your
listening station.

Actually you can however there are costs to doing so. Just check out
my artical on this subject at
http://www.milaircomms.com/review_stridsberg_mca204.html as I mention
in the artical when you can and can't use a BNC T connector.

Thanks,
George

Is there a cell mod for the late run of pro 2030's. I'm aware of the modification for the earlier models by cutting the jumper L101. But on the unit I picked up there is no jumper at that location on the pc board, just 2 plated thru holes, I have no schematic, so I can't tell what pin on the processor would allow me to possibly perform the mod, so if anyone could help It would be greatly appreciated. Thanks

OK
Pin 1 = 6.8
Pin 6 = 2.55
Pin 8 = 2.47
Pin 2 = 13.01
I think these are pretty close
But then someone once told me close only counts in horseshoes and hand grenades.
Is Anything ever easy. :)

<M2310@webtv.net> wrote in message
news:28775-3CF1813E-184@storefull-2335.public.lawson.webtv.net...
x-no-archive: yes

Those are input/output filter caps for the 12V supply. My Pro 2006 has a very light opaque brown color in the same area. It is even on the power transformer. That could be glue used to hold down the large caps, or one of the caps could be leaking.

Check the dc voltages around IC7? TDA1905, the power amp. You don't need a signal. Pin 1, 6.1V, pins 6 and 8, 2.3V, pin 2, 12V. These are from the Pro 2005 service manual.

Tune in a weather service freq., set the volume midway. On pin one of IC 7 it should max at 1Vac on a digital volt meter. I don't have a scope. Then set the volume to max and it should peak at around 5 or 6 Vac.

3540. Background Noise Problem

Newsgroup: rec.radio.scanner
Date: 2002-05-27 11:45:41 UTC
From: pmccorkell@optushome.com.au
Message-ID: <a9c673e5.0205270345.28bdd821@posting.google.com>
Source record: 47856

I have a problem that I would like some help about. I will set out the facts as clearly as I can.

Scanner ...Yupiteru 7300
Aerial ... Simple dipole or 7 element Yagi

Problem ....

I am interested in listening to the marine VHF channels and in particular 156.6 MHz.(FM)
I live near a commercial FM station and have found that a Radio Shack TV FM trap greatly enhances my reception. I use this with the Yagi but not with the portable dipole.

However with both antennas I get an intermittent roaring sound only when I am receiving a transmission. This sound comes and goes every 15 secs or so.
It is there on a wide range of frequencies but only when in FM mode. It is not there in AM.

If I turn the squelch right down when there is no transmission, this intermittent "roar" is not there. It is only there during transmissions.

I have gone to a different geographical location (10 miles away) and there is no problem listening to the same frequency, so I presume it must be a local problem.

My yagi is mounted vertically and reception is excellent (except for the intermittent roar). If I mount the antenna horizontally the noise is almost eliminated but the signal strength is also reduced somewhat although it does appear that the "roar" is reduced a lot more than the signal strength. (There a a few other frequencies which the antennas pick up a lot better vertically, and so I would much rather have them mounted in this way.)

Although the FM trap enhances my reception, the problem still exists even when the FM trap is not in line.

It seems to me that the problem could be related to the FM station up the road but then why is it intermittent and not there when there is no incoming signal?

I have run out of ideas. Can someone give my some clues?

Cheers........Philip.

The term is "lobbying" but in some cases it's about the same thing.
This issue comes to the front every time a new recording technology
comes out. The motion picture and recording companies don't want
you copying anything, ever. They know that copying is really about
sharing, not making backups. They don't want you to share, the want
you to buy. They probably figure that so few of the copies are made
for "backups", as compared to "sharing", that congress should outlaw
copying. I'll bet they bitched when consumer record cutters came out.

I have for sale 1 full size "HY-Gain" beam 10 and 15 meters. fully assembled for your inspection. 13' Boom and longest element is 22' $100.00 I also have a steel tower totaling 25'. this is in 3 sections 1 10 foot st8 and 1 5foot st8 and 1 10 foot top section. I don't not have a rotator. $50.00. pickup only from Nashua,NewHampshire. I am selling these because they are to big for my new QTH. This beam has spent a large portion of its life in storage. 73's Jeff AA1GR Please note that this beam is a top proformer on 10 meters and can be tuned for "CB" 11 meters as well. and can be mounted either verticaly or horizontaly.

Unless I've missed something there are no "all band transceivers with a tv interface". ICOM does have a VHF/UHF TV module, but that's not 2 ghz. ferquency coverage. It doesn't work like that. No tv interface module will cover the 2 ghz. range. The unit I have been testing is a monitor with a built in scanning feature from 2300-2600 mhz. If you know of a specific brand and model "tv interface" that covers 2 ghz., post it. Typically frequency coverage stand alone equipment such as EMCEE for IFTS transmissions, MDS and MMDS equipment, 2.4 ghz. amateur radio and low power 2.4 ghz. "senders" are available.

To decode satellite wefax, you need software designed for that application.
Typically the satellite audio signal is inputed to your
computer's sound card and the softward decodes the fax and displays it on your
terminal screen. See my webpage for SATFAX which is
software designed to receive satellite wefax using scanners/receivers that
typically have bandwidth of +/- 20 khz.

badfood4 wrote:

I searched the Kenwood webpage but could locate any such model. I am not familar with the Kenwood model specifications but I would bet that the upper frequency cutoff is 2450 mhz.. Per my 50 state 2 ghz. frequency directory be advised that by design most of the "interesting" video transmissions are ABOVE 2.4 ghz. and with few exceptions, not at or below 2.4 ghz. This is done because with the exception of the unit I am using, all off the shelf equipment available to the consumer for purchase does not receive above 2450 mhz. This is so you CANNOT receive these transmissions. An equilivant comparison would be using a tv set that received vhf channels 2 through 6 but not 7 through 13.

Helmet cams, doggie cams, and the Wavecom video T/Rs are on or near 2.4 ghz., but those are not the transmissions to which I refer.

Yeah, that's a real good idea. I'm sure that low band Fire Service licensees would love that interference. If you want to get your ass stomped by the FCC big time, then interfere with "safety of life" communications. That thinking is a sure way to confirm an individual's stupidity, get fined, have a criminal record for the rest of his worthless life and possibly community service or jail time. Stupid is as stupid does.

Wrong! If safety of communications frequencies (i.e., police, fire, rescue, aviation) are experiencing interference, the FCC inspectors/techs from the closest field office will be on scene probably before the sun sets again the day after the user notifies them. The FCC has had for some years very sophisticated direction finding equipment in mobile vans. A few years ago Monitoring Times magazine had an article on pertaining to them tracking a test transmission. It may take a while, but rest assured they will nail your ass. They usually don't go after the illegal CB operators and some others. FYI, law enforcement may use ANY RF frequency typically for surveillance as long as their low power transmitter does not exceed the maximum allowed. Obviously, they seek unused frequencies whereever. Recently, I overheard a surveillance on an itinerant high VHF frequency advising his partner not to user "channel 6", a 147 mhz. frequency programed into his transceiver because that was a ham band frequency.

Try the Radio Shack scanner mag mount antenna. Very good performer and not all that big. If you don't want it on top of the cab, mount it in the bed in a corner up by the cab. Will definitely perform better than the glass mount that they sell.

Consensus is about 50-50 with the glass mount style. About as many people like them as those who don't. I've had two, just mounted my most recent last week, and can't really talk bad about them. Can pull in NOAA weather stations from 100 miles away. They serve their purpose... especially those of us who don't want anything stuck to their car's paint.

I use an old CB radio twin truck mounted antenna bolted to a hockey stick, and poke it out the window when the weather is good (I weigh it down at the other end to do this). It is also a good indoor antenna when placed right next to the window. It works better for the lower frequencies than for the high ones since it is such a long antenna. I use an SO239-to-BNC adapter to plug the coax into the back of the scanner.

On Sun, 26 May 2002, it was written:

They are fun to play and experiment with, especially with those units that have a good deal of 3rd party quality software support. Other than that, if you've already got full coverage scanners and shortwaves, you're not going to hear anything new...

The absolute best way to get frequencies for your area is:

1. Go by your local Radio Shack and purchase a copy of their
frequency book "Police Call."

If they don't have one in stock, then order one and talk to the RS
manager about them keeping this extremely important reference
book in stock all the year round.

2. Order your copy from Grove Enterprises located in Brasstown, NC.

3. Because you have access to the Internet, I'm honestly shocked that
you didn't go into your search software and look up anything you
could possibly want, including the frequencies for Knob Noster.
If you absolutely couldn't find what you want in any of the above
sources, it seems even more obvious to me why you didn't call
up the FCC via software and query their computerized master list
and print that out.

The most important part of the exercise(s) above, is that you will
never have to go back and embarrass yourself again in front of several
thousand people by asking something you should either already know,
or certainly where you can go to get the information you want. How
many people do you know, outside of yourself, would have the
slightest idea where Knob Noster is even located?

I don't mean to get sharp, but this kind of stuff gets old after a
while. If you lived in New York or Los Angeles or even Chicago
I wouldn't complain. But the total population of Knob Noster
can't be more than 3,000 people. I've driven throught it more
than once and it's not much more than a wide spot in the road
which is why you get all of your political support from
Warrensburg or Johnson County.

[See Below]

Roger D. Cravens, Jr. [KE4YQZ]
Kansas City, Missouri

158.7750 L City of Knob Noster
155.2050 S Knob Noster Public School District

154.1900 F Warrensburg Fire Department
154.2800 F Warrensburg Fire Department
154.3700 F Warrensburg Fire Department
155.0550 L Joint Police/Fire Department
154.8300 P Police Department
155.3700 P Police Department
155.4150 P Johnson County Sheriff's Office Dispatch
155.4750 P Johnson County Sheriff
155.7300 p Johnson County Sheriff
156.1050 R Johnson County Roads Department
158.9850 R Johnson County Roads Department
156.0000 L Johnson County Soil & Water

You're also just West of Whiteman Air Force Base which as you
should already know is home to our newest and most powerful
bombers.

These few military frequencies should get you started. You
didn't mention what kind of scanner you have, but for many
of these frequencies you will have to have access to the military's
224-400MHz frequency range. Only the most expensive scanners
normally have this particular range of military requencies.

I have only included a handful of their frequencies - just enough
to show you that they really are there. With all of the political
stuff currently happening in the world, I'd stay glued to the USAF
frequencies over at Whiteman AFB and MSNBC or Fox news for
the current information in terms of when it is best to listen in.

Airfield Operations:

[Frequencies removed for this public message for military security
reasons]

There are many more including these trunked frequencies. I hope
you have one of the newer scanners than can follow a trunked system:

[Frequencies removed for this public message for military security
reasons]

As I said, there are quite a few more frequencies and military
frequencies. But telling you what they are would be a waste of
my time and I'd be doing all the work. Now it's time to get you
off your rear end and you go to work for a while. By the way,
if you don't want to work that hard, then I also strangly recommend
you invest in a frequency CD. The standard civilian CD can
be purhcased from Grove Enterprises, there is also another good
one in the back of 2002 Radio Shack frequency guide, but
if you have to get involved in the federal government frequencies
then Groce enterprises is the only way to go.

Go to a Radio Shack in Warrensburg or Sedalia and ask for a local
frequencies list. If they have one, chances are it will be free.

Geez... what a nice way to introduce someone into our hobby.

Thanks for the freqs Roger and for being an ass. At least I know there are still folks like you out there. Didn't know about the FCC giving frequencies or getting them from RadioShack. If you don't like giving information or helping out, don't do it. If you know so much and don't share, who cares. I'm not embarassed pal. I didn't know so I asked. Is this a group where everyone knows the answers? Relax. I sent you an e-mail saying more. You'll get it I'm sure. If you feels it's your info and yours only, keep it. I don't need to hear your ass talking for your mouth.

I have both PC controlled scanner and shortwave. I like my BC895 but seldom use the PC control and could easily do with just a straight non PC trunking scanner. I also have a PC controlled TenTec RX-320 shortwave and you couldn't pry it out of my hands.With all the 3rd party free software available it's real hoot. When used with Tom's Scan320 software its awsome for monitoring utilities. www.tentec.com

Check out your NWS service page:
http://tgsv5.nws.noaa.gov/nwr/nwrbro.htm
Find your state and it should tell you what day of the week
weather radio stations test their alert tones.

In MANY states, using the information you obtain from the scanner to
interfer or otherwise use to your advantage is, HIGHLY ILLEGAL.

Oh, yes...
Mobile use of scanners is ILLEGAL in some states, also.
Check your laws first...

Everyone has a bad day and everyone can be an asshole for
one day out of their lives.

This one was just my day! I did write him a letter of apology
plus gave him a shit-load of frequency listings that he would have a
very hard time poking them all into his scanner. Probably a thousand
or so frequencies - and most were not duplicates.

Ask him about it next time you drop him a message - I'd like to know
where he put it all after he printed them all out, hehehe!!!

Roger

If you follow the Terms Of Service, PayPal will never put a chargeback against your account. That means you must only ship to a verified address among other things.

PayPal is the only service I use for all of my online selling.

I used to use BillPoint--until they issued a $1500 chargeback against me b/c of a scammer--through no fault of my own. (I followed the TOS).

BillPoint Blows. PayPal Kicks major ass...

Heck, any cheap ass scanner will allow you to listen to the local donut eaters. No need to spend $600-plus to do that. As for nabbing corrupt cops, you have been reading too many comic books. Do you seriously think you're going to hear anything? They're not that stupid. What a fantasy!

There are lots of sites on the Web that will explain the trunk tracking concept to you; you need to figure out whether your cops use on of the TT systems and if so, get a scanner that does trunk tracking. Google worked well the last time I checked.

But really, if you're asking thiese sorts of questions, you must have come up with the idea of spending hundreds of dollars on a scanner by picking a number out of a hat. Asking what the "best" of anything is is sheer nonsense. Would you ask "What is the best cow?" for instance?

Me too.

After doing a lot of reading, I recently bought a Radio Shack Pro-2053 on sale for $179. That's a console / base unit. The same technology in a hand-held comes in the Pro-93.

These scanners are very current models that should be capable of doing just about anything you want or need to do. Dual-trunking, EDACS, alpha-tagging, computer-interface for memory management, etc. They do more than I personally need.

Reception (sensitivity, selectivity) seems to be excellent, even with the standard antenna. I get more than I want to hear. The challenge is in paring down the frequencies.

Good support is available. There is a Yahoo chat group (search on "Pro-93"), and Radio Shack is often helpful also. Some free sotware is around. Win93 is the one I got.

I also bought a used Uniden BC895xlt for less money than that. I have yet to receive it, so I won't comment except to say that this is supposedly one of the classic, great scanners. It isn't as tricked-out as the newer models, but it is very good. Depending on where you live, it's probably good enough. Better than good enough.

If you can spend more, take a look at the Uniden BC780xlt. It is also very current and very well-supported. As of the moment, this is pretty much the state of the art scanner for the under $500 market.

Any of the above will get you going. People are around who have them and who will help you.

Good luck!

Harry

First, check if you require trunk tracking capability.

If not, consider the Uniden/Bearcat BC278CLT, on sale
for $129 at Farm and Fleet. (I don't know if there's
a Farm and Fleet in your area.)

Hi guys new to scanning, I asked before about a getting a better signal, I bough a mag mount a little better, but stations still have too much static.

Now someone mentioned something about modifying a chip ?
Is there such a thing and does it work, to bring in better signals...

Any help would be appreciated.

Thanx - you can EMAIL me direct if you like......

This is something illusory that I suspect will slowly disappear.
People forget the time value of money. Yeah, sure, they'll earn an
extra $20 here or $30 there --but how much did they shell out to get
that money? And what about the botched sales where they end up taking
a loss?

It may be true that the true flea market nature of Dayton and other
hamfests may slowly attenuate as time goes on. Further, as people get
burned more and more on E-Bay, I think that flea-markets will go up in
price because you can see and poke at the things people are selling
while E-Bay's prices will go down some. At a flea market you can
actually see what you're buying and you can pay for it and carry it
away on the spot.

And by the way, hamfests are not just about flea markets. Yes, that's
a big part of them. However, there are still symposia, VEC testing,
socializing, and yes, even operating various radios and the like.

In a word: "isolation"

Your scanners will leak a certain amount of it's local oscillator.
For the purposes of most immediate listeners, it's only a milliwatt or
two. However, when you apply that kind of signal on the same coaxial
cable as another scanner, you'll start hearing all sorts of
interference products from each of the two scanners.

These interference products will result in phantom signals with dead
air or possibly IMD products with other existing signals.

My suggestion is that since these scanners are different brands, with
different IF and LO systems: try it. If it doesn't work, get a real
multicoupler with an appropriate high isolation splitter. And by the
way, beware of those inexpensive amplifiers. They often increase IMD
problems. As amplifiers go, you don't need much gain. If your
multicoupler has only four ports, you should have no more than seven
dB of gain from the amplifier (a signal split four ways would see six
decibels of attenuation plus an additional one decibel for connector
and other miscellaneous losses).

Not that I'm an expert, but as I had posted, a cable A/B switch would
provide total isolation, and be much cheaper than an amplifier and splitter.

Hank

Recording may currently be legal, but many rights have ALREADY been
lost. For instance, if you owned a copy of a video, say one that your
kids watched often, it used to be legal a few years ago to copy that
often watched video and then wear out the copy. But now under the
digital millenium copyright law it is ILLEGAL to circumvent any copy
protection. So your right to make a backup is not gone, but you cannot
exercise it legally, so your right to make a backup is gone.

Hey, there is lots of stuff going on, the rules changed alot a few
years ago, and Hollywood wants them to change more.

But with an A/B switch you couldn't use both scanners at the same
time.... Want cheap, just unscrew the connector from one scanner and
screw it to the other.... can't get much cheaper....

Not that I don't understand, just I don't care about anyone ripping
off software from a giant multi national company run by a multi
billionaire, who has been squashing his competition in not very ince
ways, been pushy in the market and has been selling their software at
totally ridiculus and rip off prices well before anyone thought of
pirating their software.
Your heart can bleed for these bastards each timeyou hear that
someone has made a copy of Windows. I know mine won't.

I don't believe he wants to listen to 2 at a time. BTW, isn't unscrewing
from one and connecting to another, one at a time?

The first thing you have to do is figure out of the local stuff you want to listen to is regular, trunked or digital. If digital you are out of luck for the near future. If trunked then the Radio Shack 2053 base or Pro 93 hand helds are good options. Only buy if on sale the regular prices are too high. The 2053 and 93 also do regular scanning too. I have no trunking around me at all and use the Pro 2053 with excellent results.

Ok I'll say it again, If your Cell/Cordless phone frequencies come in to MY HOUSE and I so happen to be monitoring those frequencies then they will be listen to. You dont like that then scramble the frequencies you are using..

Besides cells are boring and if you really want to listen to cells then go to a park or mall and thats what your gonna hear, one side.

Becuse the software slows you system down to a crawl, I have a 750 w/768 ram
and it would go very very slow, and when I emailed there so called tech
support in 3 times in Dec 2001, lets say I'm still waiting for a reply back.
So Winscan doesnt work, tech support sucks and Yes I got me money back and
sent there software back to them.

I would only use this if there is nothing else to use.

I plan to get a scanner for my car ('84 Mercury Grand Marquis). For the antenna, I plan on getting the FireStik Mobile Action Scan (Model: MS-4) (http://www.firestik.com/Catalog/MSM-3&4.htm) and for the mount, the Jeep Bump-Stop bracket (http://www.firestik.com/Catalog/MK-JBS4R.htm). I will mount it to the extreme right side of the rear bumper.

My first question: Do I need to get a spring for the antenna, or should it be OK without?

Second question: Would anyone reccomend a better spot to mount the antenna? In the future, I may get a second antenna on the opposite side of the car for my CB radio with the same mount, and a 5 foot CB antenna. I park the car in a garage, so I can't do something like mount a 5 foot antenna on the roof.

4 foot, spring?. I use KW-7's without springs. Work a lot better
then a 4 footer. Go with at least a 5 footer. Center & higher is better.

I should have clarified a couple of points; one, I did go to their website, and no info was available, and two, is there a series of keypresses/buttons that can be entered, to test the alert tone? I'd like to be able to test it at will, and not have to rely on the NWS test tones, since they usually happen while I can't use the radio. Thanks for the replies so far, though. I appreciate it. -Bob

3616. Yaesu FRG-9600 audio

Newsgroup: rec.radio.scanner

I bought a used Yaesu FRG-9600 and whenever a signal is received, breaking the squelch, there is a loud and annoying tone (kind of like a dial tone) behind the received signal.

Does anyone know if this is normal for this radio, or does it need repair?

Thanks

If you had a radio that receives up to 2.6Ghz how would you capture the
video signal. Could you tap the baseband output or the 10.7 IF out and run
it into a TV?

Why not just call them up on the phone? 1-800-whatever. They are
okay to talk with.

Harry <--- who thinks you got a great deal on the radio, but who
wants to get a Davis weather station himself. Just tell me how to
install it in a way that looks nice. (I'll try calling them and
asking them that.)

I think you are the one that needs to be educated. Uniden makes about
half of RS's scanners!! GRE makes the other ones. Both have good and
bad points, but not all Uniden stuff is bad.

Sheesh! I didn't think I was going to really start something with a simple question. :-)

I think I have learned quite a bit just by reading everyone's various responses.

Once I get moved to Nebraska next month, I'll have to get one of the couplers so I can use both scanners simultaneously. Until then, I'll use the "cheap" method - disconnect the antenna from one scanner and connect it to the other.

Thanks for everything, guys!!!

Emergency Situation Report e-mail list for Pennsylvanians

PA-SitRep is a free, 100% non-commercial,
nonprofit, e-mail list and web site.

The PA-SitRep emergency traffic e-mail list is a
tool that will enable you to monitor and report on
major emergency situations throughout the State
of Pennsylvania including weather emergencies,
natural disasters, environmental disasters, civil
disturbances and threats of terrorism, major fires,
and manhunts.

Subscribers are encouraged to utilize their home,
work and cell phone e-mail addresses for receiving
messages from the PA-SitRep e-mail list.

Because messages posted to the list are limitted to
situation reports of MAJOR emergency situations
within the State of PA, message volume on
PA-SitRep is EXTREMELY low.

PA-SitRep is also building a list of PA-SitRep
Contacts, most of whom are Amateur Radio
Operators (http://www.pa-sitrep.com/contact.htm).

PA-SitRep Contacts monitor our higher volume
SitRep/Discussion mail list and post situation
reports ot the discussion list and to the main list.
PA-SitRep Contacts also submit their contact info
for our site and may be contacted for a first
hand situation report should an emergency
situation arise in their area.

Please visit the site to learn more:

http://www.pa-sitrep.com/pasitrep.htm

Thanks. We'll look forward to your participation.

-David Kleber, KB3FXI
PA-SitRep List Owner and PA-SitRep.com Founder

Hey there,

I used to listen to the local Sheriff's department. The frequency I had has gone dead. I guess they moved to a new one.

I am unable to locate this new frequency.

If anyone can provide me with the frequency for the Santa Clara County Sheriff covering the Cupertino area that would be great. I think they were called the West Valley Station.

Thanks!

I couldn't dissagree more, , , , , ,

I have bought several radios on Ebay at prices that would blow your
mind. How about a IC-751 for $300 bucks? Works and looks like new.
I also bought an IC-=735 a year ago for $500, and it also was like
new. Yes, I had some minor problems when I first started using Ebay,
but you just have to learn the ways of bidding.

MY complaint with "new" radios is that the damn knobs are too small,
they seem to be built for midgets and children.

Anyway, Ebay is for INTELLIGENT buyers and can give some trerriffic
buys , , , , ,Just don't let the price get away from you. I find that
it is better to snipe. My 10 second bids have almost always won. and I
never, never, ever, raise my maximum spending amount.

FROM rec.radio.scanner:

it would seem Transcrypt Secure Technologies has started an
advertising campaign against the average scannist/volunteer
firefighter:

See their ad, "Who's Listening to you now" as shown on
http://www.wpascanner.com/transad.htm

jeez, encrypted fire dispatch!?!

what's next? encrypted NOAA weather radio?

I agree. Also, note that THEIR website is at
http://www.transcryptsecure.com

The only email for them I find embedded in the pricing page:
cgeorgeson@transcrypt.com

I recommend contacting these folks, both at their telephone number -
THAT will get their attention IMMEDIATELY, like right now. Also an
email, which will give them a record of our opinions. Keep it polite
but firm. Some points -

- Demand that they change their ad that paints all scanner listeners
with the broad brush of

- The HUGE majority of scanner listeners are law-abiding people who do
NOT interefer with ANY police or fire activities, ever.

- a great many listeners are volunteer firefighters, EMS and reserver or
off-duty police officers and firefighters, who use their scaners to keep
abreast of incidents that may impact them

- the occasional news reports of arrests where the "police confiscated a
scanner" PROVE that their having a scanner does NOT prevent police from
successfully investigating and arresting these crooks... i.e., they had
a scanner but got arrested anyway.

I'm sure you can come up with others. I, personally, wouldn't get into
the "right to listen," stuff, they don't care, and the argument could go
on forever.

Again, "homeland security" has unfortunately become a magic buzzword for
HUGE amounts of governent money flowing out to anyone and everyone who

uses it in their request for grants, funding and contracts - whether they're effective or not

Pass the word to ther scanner & professional groups you may belong to.

3650. BC-200 FS

Newsgroup: rec.radio.scanner
Date: 2002-05-29 18:28:03 UTC
From: bfdp1@msn.com
Message-ID: <1235373c.0205291028.26bc94a0@posting.google.com>
Source record: 47816

I have a Uniden BC-200 (1989-1990) (unmodified) for sale with OEM antenna and case. Radio is in perfect shape as it's seen little use and been in the case these years. Wall chargerincluded.
I'll also include a NEW/UNUSED 1650 Nickle Metal Hydride Battery pak insert.

$125 shipped. LCD is good.

A resistor on the end of the pot to increase the pots resistance,
might do the job ?
Try adding a quarter of the pots resistance
i.e. if 100K pot ? add 25k (or an adjustable 50k preset)

I wouldn't go quite that far. They do have a rather condescending attitude to scanner enthusiasts, however.

But before you rant too much, know this: These folks aren't using anything more sophisticated than DES encryption. DES has been cracked with brute force techniques.

The lower models use everything from crude speech inversion to some rather silly and weak analog spread spectrum stuff that you could undo with a sound card.

Frankly, I'm not impressed with their products. I'm also surprised to see commonplace ham radio gear and aviation equipment with models listed next to them to do their "encryption."

It's all a bunch of sales hooey. They're not hard to crack.

Has anyone else been having problems with
http://www.apbnews.com?
I try to listen to stuff and sometimes it tells me that the file can no longer be found. That is using RealPlayer as my player. If i use Windows Media Player it just tries to connect and doesn't get anywhere. It seems like it would be a nice way to listen to scanners around the nation.. if it worked.
Chris

yes, make silly assumptions like you.
Unfortunately, I still don't really care......

either way I am still going to use priated software, and it doesn't
matter if you or any other people think otherwise.
I doubt you will ever stop it, so why argue??
By the way I am a selective software pirate, if the software is good
enough, I won't copy it, or crack it, i''l buy it (just like I did for
ARC780)
As for anything else produced by rip off merchants that doesn't work
100% to my satisfaction, or os grossly over prices, thats another
story.
Deal with it.

3660. ID Tracker Supports LTR System

Newsgroup: rec.radio.scanner
Date: 2002-05-30 01:00:39 UTC
From: "David M. Hitchner" <biteme@spammers.net>
Message-ID: <PNeJ8.58422$Bo3.4795640@e3500-atl2.usenetserver.com>
Source record: 47826

ID Tracker now supports LTR systems.

We just got an LTR system in the area so I was able to add
support for those type systems to ID Tracker.

http://personal.bellsouth.net/~kd5eis/IDTracker/IDTracker.htm

In order to get the longer IDs in the ID list it was necessary to
change the default column widths. If the columns do not display
properly edit the file "IDTrack.ini" and remove or change the line:

ListTabs=12,38,156

The values can be adjusted to adjust the column widths.

Much as this thread has outlived its usefullness I can't resist asking where and when you have ever found a software product working to your 100% satisfaction? Unless you are very easy to satisfy.

In decades of working with 'very expensive' - make that multi-million dollar - professional software I have yet to encounter any product that manages to provide 100% user satisfaction. Even the stuff that runs FMS on Boeing jetliners or ATC systems has yet to provide 100% despite constantly being upgraded, at great expense.

pardon me!
Well I'd like to thank you for your help. I am very grateful.
After testing at the chip then the speaker proved a bad c226 capacitor.
I noticed my ancient BC210xlt has the same tda1905. Can I test this radios
Audio circuit the same way it was tested with the pro-2005?

Corrected.
You have way too much time on your hands Richard.

One of the design flaws of the Yaesu FRG 9600 is feedback from the internal speaker, especially at high volume. I've got two of these beasts, and the cheapest (and easiest) way to cure the feedback problem is with an external speaker. (Radio Shack sells one for about $14.99 which works fine with the FRG.) Other than the feedback problem, it sounds like you may have your rig's squelch set too low. Try setting the FRG's squelch control to the 1 o'clock position and see if that improves the audio.

That's why I mentioned the Pro-2053. I would never try to argue
that it is as good as the BC780, but it's certainly at least half as
good. Three-quarters, give or take.

They're not encrypted, but they change frequencies so fast that even if you
scan all the freq's that the phone uses, you'll never pick it up.

3683. PRO-94 Trunking Info Needed

Hello All,

It seems that I have either misplaced or lost the owners manual for my PRO-94 and need info on how to program the trunking feature on this scanner. I kind of remember a little on how to do it but not completely so I have given up on trying to figure it out by myself. If someone can give me a brief synopsis on how to program in trunked systems it would be greatly appreciated.

Thank You in advance,
Dave

Message-ID: <3CF682BC.4050804@licensed4fun.com>
Source record: 47754
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave

The shuttle is due to launch today at 19:44:26 EDT. I have a scanner online broadcasting Kennedy Space Center freqs from security, fire, launch support as well as the STA (Shuttle Training Aircraft).

Also included in this scan are the Combat Air Patrol freqs of the fighter patroling the skies over the Space Center.

Closer to launch time I'll lock the scanner to 126.6500, the freq used by the STA. About 1 hour before launch the STA will fly approaches to the shuttle runway as well as climb and measure the cloud heights. 99% of the time it will be from data he reports which will lead to scrubbing a launch.

I'm located about 40 miles from Pad 39-A and can pick up most of the comms pretty well. It should make for some interesting scanner.

To listen go to http://www.MilAirComms.com and scroll down until you see the section "LIVE AUDIO! Daytona Beach FL".

Have fun,
George

I am looking for software that can decode the pager transmissions that I can receive with my scanner. If anybody has any info please reply with the info must be compatible with a YAESU VR-500 Communications Receiver. Must decode POCSAG, GOLAY and FLEX. any info will be appreciated. Email at TPDB60RODR@aol.com write in the Subject Line: Pager Decoder Software.

Only true if the phone is a spread spectrum type. You won't find that in a cheapy 900MHz phone. Of course, you won't even find Digital in most of those cheapies...

Chances are if you own a cheapy 900MHz phone, you can be heard...

If their were less questions and arguments about 800Mhz Analog Cellular mods and recievers,Citizens Band and also morse code for amateurs, , most newsgroups would have no posts.

instead of whining about these issues, why dont you find something else constructive to do with your time. bulid an antenna, make a reciever or some other gadget. Then you let others know what you are doing and someone improves on your idea.

I know i will see alot of problems regarding my message but its true. here are my thoughts for the record.

Cellular Scanners-- Why do people want a 800Mhz full coverage reciever today. Most areas are using some form of digital service, and not even in the 800 band anymore. What is so interesting about listening to cellphones? Ive had radios that are capable of it, and never even listened to that portion. I think you just want something that has no gaps, and are willing to pay more for something that most wont listen to. If its so good how come i never see monitoring posts about how Mary got her nails done?
Unless you are in the FBI and are trying to foil the next terrorist action, dont be bothered with cellular capable scanners

Morse Code-- have you looked at new licenses lately, looks like our ranks are dropping. Ive been a Tech(No-Code) for three years and would like to use HF but could care less about morse code. Its an antiquated mode, which had its time, although still usefull sometimes, if we keep saying we need Morse code, us amateurs will be way behind times(which we still are). Lots of people say, when a repeater ID's or i am tuning around the morse sub bands, "Is that Morse Code, someone still uses that?" I say yes, its part of amateur radio. The person whom im talking to usually says "ill just go to Walmart and get those radios for $50 and dont worry about the code" Amateurs now adays need to concentrate about leading edge technology, like we once did, and stop hanging on to the past. PSk31, APRS, IRLP, and satellite is the future, so we should stop saying amateur radio is only HF and Morse. The military does not use MOrse anymore, they use ALE type signals, which is faster, and almost error free .Those of you that have been around for a while should get off your "Extra or Advanced" horses and get some new blood into amateur radio. Also a Tech (no code) IS still an amateur, so we should be treated like one. I hear it all the time, Im speaking to someone about some technical topic, and they happen to be at QRZ.com and look up my call. Then they say how come your only a tech? didnt you pass the code test? i say no and dont want to be bothered. "well its been good talking to you, 73" is the common response. And also those that upgraded, change their whole demeanor towards you like they dont remember you. WOW!! your a general,

advanced, or extra! can you set up a packet node, or work a satellite via a digital mode. NO, gee i guess that morse code is really good!

Citizens Band- Those that are on SSB are almost like amateurs, and some wont get a license because they dont like the dryness of amateur radio. Regular AM'ers are usually a 50/50 bunch, some are the nicest and most helpfull people youll ever meet, and the others, well you know what im talking about.Amateur ops always complain about how 11m was stolen and CB'ers dont know anything. Well guess what, if its about amplifiers(yes ILLEGAL on 11m), DXing (less than 125 miles wink wink) or just general radio stuff, some know more than some amateurs. If a "general" is confronted by one of these CB'ers they say "well your so smart do you know Morse code" CB'er replies "NO!!". That amateur will either leave or will find what channel they are on and throw a carrier or send code with his friends. This is not the way!!! "cant we all just get along"

well thats it for now, if i made any spelling or puncuation errors, oh well!!

Sincerly,

Steve Bossert , KC2GOG (tech and proud of it)

and i dont need to hide behind an alias like some others out there!!!

At least the radio oriented ones, it seems.
I subscribe to some where radio is rarely mentioned.

It's the onerous mix of bad politics and technology.
(keep your laws off my body, and out of my receiver)

I don't think any readily available "scanners" (blocked or not)
cover the sat phone bands where the FBI is concentrating.

> Morse Code-- have you looked at new licenses lately, looks like our ranks
> are dropping. Ive been a Tech(No-Code) for three years and would like to use

Now that the ionosphere is shot to hell,
that's sort of a moot point.

> Its an antiquated mode,

Just as a paper and ink book is.
Some folks (like me) are hopelessly nostalgic, though.

> which had
> its time, although still usefull sometimes, if we keep saying we need Morse
> code, us amateurs will be way behind times(which we still are).

If being contemporary is important,
and working the world is an objective,

then get a cell phone.
A multi-minute call plan,
3 watts,
and you have anywhere on the globe with Q5 clarity.
Up to date?
Get your cell phone in a color scheme to match your Hilfiger's or FuBu.

> Lots of

That's just the niche of users that GMRS and FRS (and originally CB) were
designated for.
.....and $50?
Walmart (Santee CA) has Bellsouth Communicators (FRS) for less than $10
....hellofa deal.

> Amateurs
> now adays need to concentrate about leading edge technology, like we once
> did, and stop hanging on to the past.

Been down to HRO lately?
Several kilobucks will get you all the leading edge technology you can afford.

> PSk31, APRS, IRLP, and satellite is
> the future, so we should stop saying amateur radio is only HF and Morse.

They are "both" amateur radio,
all the digital gimmickry you referred to above,
as well as the old brass pounders on the "long bands".

> The military does not use MOrse anymore, they use ALE type signals, which is
> faster, and almost error free .Those of you that have been around for a
> while should get off your "Extra or Advanced" horses and get some new blood
> into amateur radio.

No thanks.
That's the equipment vendors that want more customers.
The bands are crowded enough (when they are open)
without any more impatient "new blood".

> Also a Tech (no code) IS still an amateur, so we should
> be treated like one. I hear it all the time, Im speaking to someone about

There's arrogance everywhere you go in life, not just hams.

> And also those that upgraded, change their whole
> demeanor towards you like they dont remember you. WOW!! your a general,

> advanced, or extra! can you set up a packet node, or work a satellite via a

Now you are starting to sound like a sniveling sour grape whiner.

> Citizens Band- Those that are on SSB are almost like amateurs, and some wont
> get a license because they dont like the dryness of amateur radio.

A real comedy show too.
"I'm QRT and standing by" ;-)
If ham is so bad,
why don't they develop their own set of brevity codes,
instead of making such a pathetic attempt at plagiarizing from the hams?
With all the superfluous and obsequious blather on freeband,
the use of any shorthand isn't expedient or even necessary.

> Regular
> AM'ers are usually a 50/50 bunch, some are the nicest and most helpfull
> people youll ever meet, and the others, well you know what im talking
> about.

Just like in the real world.

> Amateur ops always complain about how 11m was stolen and CB'ers dont
> know anything.

I think you are being too broad in your assessment here.
Damn few hams of today even remember the late 50's,
let alone the transference of a scarcely used band to the general public.
(the lowest common denominator aspect didn't emerge until well into the 60's)

> Well guess what, if its about amplifiers(yes ILLEGAL on 11m),
> DXing (less than 125 miles wink wink) or just general radio stuff, some know

My 10m amp was made by someone who caters to the CB market.
Parts is parts,
and if he can sling 'em together better and cheaper than Mirage,
then that's where I'm gonna buy it.

> If a "general" is confronted by one of these CB'ers
> they say "well your so smart do you know Morse code" CB'er replies "NO!!".

Maybe you should look beyond the boundaries of the radio community.
You'll likely see that what you're complaining about is part of human nature,
and radio is just reflecting those squabbles within its own scope.

Very interesting indeed Steve. I have but on question...what kind of goofs do you talk to anyway? I've never heard anyone ask or make comments like you say have been said to you concerning CW.

And guess what Steve....I've got my Extra, had it a while now, and I do satellite, and V/Uhf weak signal, and HF and Contest, etc. etc. I do it on voice, digital and believe it or not CW. So please don't stick us all in this bag you apparantly have created.

If you don't care to do CW...fine...less QRM from a lid to contend with. I could care less if folks like you, that apparantly hate CW, don't want to operate CW. Why do you think that bothers types like me that enjoy it?

i did not want my post to come out in a negative way, and i should not of even of bothered to write, because i ended up addng fuel to the fire.

i really should of made the point that when radio communication first began, it was all about improving technology. i really dont see that anymore, and i am NOT talking about buying a station. thats just like some rich guy buying a brand new Harley Davidson and custom leathers, trying to pass himself as a hardcore biker.

and by the way i am not a LID, and its what ever floats your boat (as far as what mode you operate)

all im saying if you hold on to the past you cant go foward (i.e Morse Code)

if certain people enjoy Morse dont force it upon others, just like i am NOT making you agrre with any of my statements, they are open forum, and oh by the way

OK, understood. I'll let the 'real' LIDS out there read your Morse at the end.

Hi, Steve...

Ham radio is such a large, diverse group that ANYONE can find things that are repulsive to him or her. In other walks of life, we just avoid folks whose behavior we object to, but on ham radio, that's hard to do. In my case, the list of things that drive me up walls isn't too long, but --for example-- my top three are...

1. The "personal" here is Bill.
2. Please help... I **NEED** modifications for my new radio... ANY modifications!
3. If you don't know code (preferably 20wpm) you're not a real ham.

Refering to one's name as a "personal" is repulsive to me. I guess it migrated from CB... dunno. Then I think about the term "handle," which was common during my first 30 years. I used it too, though I haven't in years. "Handle" conjures up interesting pictures and certainly is no less ridiculous than "personal," so I just keep my mouth shut and move on.

Hams who spend good money on new radios and then simply cannot LIVE without modifying them makes me wonder why they bought 'em in the first place. Most of the mods won't ever be used and probably void the warranty. Dumb, dumb, dumb!

The worst behavior on the ham bands in frequently the Extra/Advanced class portions. I know many no-code techs I much prefer as friends rather than some of the higher-class bigoted jerks in our hobby. I am Extra class but I consider this elitist attitude to be the epitome of ignorance. They probably think the same of me.

Anyway... until this message, I have never mentioned any of these pet peeves on the internet, and probably won't again. The point is, there are lots of different kinds of people in this world. Though it sometmes takes effort, I just accept those differences and move on. I tell myself it's verbal "people-watching."

73 & Good luck... Ed Juge, W5EJ

Pictures: http://wind.prohosting.com/w3x/pro-46.html

I have a Radio Shack PRO-46 for sale. The date code is 8A3. I have reduced the price and the next step will be eBay if I don't sell this time.

I have tried the keypad trick and it works, allowing you to search the upper cellular band. You can save cellular frequencies to monitor memories and transfer them to channels to scan them like regular frequencies. You can't, however, directly enter cell freqs (normally you won't have to do this anyway), though this scanner can be modified internally if you want it to do that. Of course, I can't be held accountable if you try the mod unsuccessfully and ruin a perfectly good scanner. :)

I am asking $130 shipped express to the USA (there are no customs fees for you to pay). I may be able to knock off a few bucks for Canadian buyers.

Please don't hesitate to e-mail me directly if you are interested, or if you have any questions. I will be happy to respond to you promptly.

3715. FS: Regency montiradio model TME-8A 8-channel aircraft monitor

Newsgroup: rec.radio.scanner
Date: 2002-06-01 01:31:40 UTC

Message-ID: <3a26ea1.0205311731.3ae2189f@posting.google.com>
Source record: 47781
Cross-posted to: rec.radio.scanner,rec.radio.swap

For Sale: Regency MonitoRadio model TME-8A 8-channel programmable crystal controlled aircraft monitor. In fantastic condition with original owners manual with no markings. I estimate the age of the radio to be from the mid to late 1960's. Frequency range is 118-128 MC. Has built in telescoping antenna and is in great operating condition as far as I know. Asking $20 obo. I can provide pic of radio if requested. Radio is in fantastic condition and would be a great addition to collectors of vintage scanning equipment.

thanks,

LP

Yeah, me too. If you don't have full coverage cellular, you don't know
what you're missing. There's a lot more there than just tired
conversation, believe me.

Try here: http://www.cbshop.com/

I haven't dealt with them personally, but I'm thinking about it. In
fact, I'm posting a request for endorsements from people who might
have right now to see what kind of responses I get.

I think someone:
a) Had their cellular capable scanner confiscated
b) Did not pass the Morse code test
c) Transmits illegally on CB with a linear
d) Forgot their Prozac today.

:)

Don't take life too seriously; you'll hurt yourself.
